The Directors of SSE plc are responsible for the preparation and presentation of this Sustainability Report. SSE takes an integrated approach to assurance, using internal audit and external assurance providers to ensure accurate and complete disclosures where appropriate. Where data has been externally and independently assured this has been noted in the relevant tables. SSE has objective reporting criteria for preparing and presenting the independently assured information disclosed in this report and the performance measures are in accordance with the reporting criteria. See sse.com/sustainability/policies-and-assurances for more information.

**The Year in Numbers**

### Absolute scope 1 and 2 GHG emissions:

<table>
<thead>
<tr>
<th>Year</th>
<th>CO₂e (Mt)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2020/21</td>
<td>6.2</td>
</tr>
<tr>
<td>2021/22</td>
<td>7.6</td>
</tr>
</tbody>
</table>

### Renewable energy capacity in construction:

<table>
<thead>
<tr>
<th>Year</th>
<th>GW</th>
</tr>
</thead>
<tbody>
<tr>
<td>2020/21</td>
<td>2.4</td>
</tr>
<tr>
<td>2021/22</td>
<td>2.0</td>
</tr>
</tbody>
</table>

### Installed renewable capacity connected to SSE Networks’ transmission network:

<table>
<thead>
<tr>
<th>Year</th>
<th>GW</th>
</tr>
</thead>
<tbody>
<tr>
<td>2020/21</td>
<td>7.8</td>
</tr>
<tr>
<td>2021/22</td>
<td>6.8</td>
</tr>
</tbody>
</table>

### Median UK gender pay gap:

<table>
<thead>
<tr>
<th>Year</th>
<th>%</th>
</tr>
</thead>
<tbody>
<tr>
<td>2020/21</td>
<td>18.0</td>
</tr>
<tr>
<td>2021/22</td>
<td>18.3</td>
</tr>
</tbody>
</table>

### Total Recordable Injury Rate per 100,000 hours worked:

<table>
<thead>
<tr>
<th>Year</th>
<th>Rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>2020/21</td>
<td>0.17</td>
</tr>

<td>20.4/6.4</td>
</tr>
</tbody>
</table>

### SSE’s business model

SSE’s business model is to supply low-carbon power to customers in the UK and Ireland in a socially and environmentally responsible manner. SSE’s strategy has three parts:

- **Energising a net-zero world:** SSE is committed to net-zero emissions from 2045.
- **Avoiding electricity distribution customers:** SSE is committed to net-zero emissions from 2045.
- **Improving an inclusive workplace:** SSE is committed to net-zero emissions from 2045.

SSE’s business model is also committed to energy solutions for customers. SSE is committed to net-zero emissions from 2045.

### SSE’s appraoch to innovation and technology

SSE is committed to net-zero emissions from 2045.

### SSE’s appraoch to sustainability

SSE’s appraoch to sustainability is to supply low-carbon power to customers in the UK and Ireland in a socially and environmentally responsible manner. SSE’s strategy has three parts:

- **Energising a net-zero world:** SSE is committed to net-zero emissions from 2045.
- **Avoiding electricity distribution customers:** SSE is committed to net-zero emissions from 2045.
- **Improving an inclusive workplace:** SSE is committed to net-zero emissions from 2045.

SSE’s business model is also committed to energy solutions for customers. SSE is committed to net-zero emissions from 2045.
2021/22 highlights

Refreshed 2030 Goals

In February 2022, SSE refreshed its 2030 Goals, making them more ambitious and ensuring they remain stretching to the end of the decade. See more on page 10.

Net Zero Transition Report

SSE published its Net Zero Transition Plan in March 2022 and has produced a report on progress against this Plan, which will be subject to shareholder vote at the upcoming AGM in July. See more on page 26.

Action for a just transition

SSE’s work over 2021/22 has reinforced the importance of a just transition to net zero, which has included a worker insights report and partnership collaboration to share learnings. See more on page 69.

Increasing climate ambition

SSE announced more stretching net zero ambitions, alongside aligning & Science Based Targets Initiative-approved interim carbon targets to a more stretching 1.5°C pathway. See more on page 29.

Powering change together

The purpose of SSE’s annual sustainability report is to disclose the impact of its business activities on people and the environment. Designed to complement the statutory disclosures in the Annual Report, SSE’s social and environmental impacts are comprehensively monitored and disclosed. Led from a strategic objective to ‘create value for shareholders and society’, SSE recognises that it has a far wider impact on the world than simply its annual financial results.

2021/22 was an exceptional year for business delivery, with a capital investment plan between 2021 and 2026 pursuing clean growth opportunities that are critical to removing greenhouse gases from our energy systems and tackling climate change. It was also a year where SSE spilled out, with greater clarity than ever before, the greenhouse emissions targets it must meet to become a net zero business.

Targets

The publication of a Net Zero Transition Plan in March was the culmination of a series of actions taken earlier in the year. New science-based greenhouse gas targets were set in November, accelerating the speed in which emissions reduction plans are delivered. This means, amongst other things, that rather than targeting to cut our absolute scope 1 and 2 greenhouse gas emissions to 6 million tonnes of carbon dioxide equivalent in 2030, we will be cutting them to 3 million tonnes. With COP26 focused on accelerated climate action, I like to think SSE’s plan is net zero acceleration in practice.

Action

Setting robust, independently verified targets is one thing. But, as our Net Zero Transition Plan outlines, the targets are only as good as the actions designed to meet them. The same argument is true for nation states and the Nationally Determined Contributions set in advance of COP26. In SSE’s case, we are clear on what we must do: we must bring about a responsible phased reduction of carbon emissions associated with unabated gas generation, and establish new carbon capture power stations, as quickly as possible. At the same time, we must increase renewable energy output – and we are developing wind, hydro and solar projects to increase it fivefold by the end of the decade.

Because SSE understands that tackling climate change is not simply a technical challenge to meet through investment in large-scale assets, SSE seeks to support the human challenge too. Working people need to become reskilled; communities must benefit from the economic activity that results and all energy consumers must be able to access the benefits a low-carbon economy can bring. These principles of a just energy transition to net zero have parity within SSE’s plans to achieve net zero.

Integrity

Any plan to meet net zero, indeed, any strategy to create value for SSE’s wider stakeholders, requires comprehensive transparency. It’s why SSE continues to quantify, annually, its overall socio-economic impact. It’s also why we publish, in significant detail, our journey in improving inclusion and diversity within the company. It also means we must be honest about the challenges we face. While excellent progress is being made – SSE’s carbon emissions are down again this year – I have no doubt there will be bumps in the path ahead. Our commitment to stakeholders is to let them know when those challenges arise.

Finally, the spirit in which this report is produced, is to stimulate further engagement and feedback from the many people and organisations that have an interest in SSE and its business activities. As always, I would encourage you to get in touch with us directly using the email address sustainability@sse.com.

Alistair Phillips-Davies
Chief Executive
SSE’s purpose, vision and strategy

SSE’s business model

**OUR PURPOSE**
To provide energy needed today while building a better world of energy for tomorrow.

**OUR VISION**
To be a leading energy company in a net zero world.

**OUR STRATEGY**
To create value for shareholders and society in a sustainable way by developing, building, operating and investing in the electricity infrastructure and businesses needed in the transition to net zero.

**OUR GOALS**
With an eye to net zero, in 2022 SSE revised its interim goals aligned to the UN’s SDGs for 2030.

- **Cut carbon intensity by 80%**
  Reduce Scope 1 carbon intensity by 80% by 2030, compared to 2017/18 levels, to 61gCO$_2$e/kWh.

- **Increase Renewable energy output fivefold**
  Build a renewable energy portfolio that generates at least 50TWh of renewable electricity a year by 2030.

- **Enable low-carbon generation and demand**
  Enable at least 20GW of renewable generation and facilitate around 2 million EVs and 1 million heat pumps on SSEN’s electricity networks by 2030.

- **Champion a fair and just energy transition**
  Be a global leader for the just transition to net zero, with a guarantee of fair work and commitment to paying fair tax and sharing economic value.

**OUR VALUES**
All of this is underpinned by a set of core values designed to guide decisions and actions in SSE.

- **Safety**
  If it’s not safe we don’t do it.

- **Service**
  We are a company that customers can rely on.

- **Efficiency**
  We focus on what matters.

- **Sustainability**
  We do things to add long-term value.

- **Excellence**
  We continually improve the way we do things.

- **Teamwork**
  We work together, respect each other and make a difference.
**SSE’s purpose, vision and strategy**

**SSE’s business model**

SSE’s strategy is to create value for shareholders and society in a sustainable way by developing, building, operating and investing in the electricity infrastructure and businesses needed in the transition to net zero. SSE’s businesses are well positioned to capture the growth opportunities generated by driving and accelerating the net zero agenda through electricity infrastructure.

### Decarbonising generation

- **SSE Renewables**
  - **What it does**: Develops, builds, operates and invests in assets that generate electricity from renewable sources.
  - **How it supports net zero**: Develops and generates zero-carbon electricity at large scale from onshore and offshore wind farms and provides clean flexible power from hydro-electricity schemes.
  - **2.4GW** Renewable generation capacity in construction*  
    
- **SSEN Thermal**
  - **What it does**: Generates electricity from thermal sources in a flexible and reliable way, and its Gas Storage business holds around 40% of the UK’s underground capacity, supporting security of supplies in the UK.
  - **How it supports net zero**: Produces progressively lower-carbon electricity and electricity system support to enable net zero transition. Facilitates increasing levels of renewable electricity by offering flexibility to balance renewables’ natural variability. SSE’s Thermal’s Gas Storage assets have potential to be repurposed to hold lower carbon gases in future, including hydrogen.
  - **5.3GW** Installed thermal generation capacity  

### Enabling electrification

- **Energy Portfolio Management**
  - **What it does**: Secures value for SSE’s asset portfolios in wholesale energy markets and manages volatility through risk-managed trading of energy-related commodities.
  - **How it supports net zero**: Provides efficient route-to-market for low-carbon electricity, supports system balancing and provides energy solutions for business energy customers.
  - **7.8GW** Renewable generation capacity connected to SSEN Transmission’s network

- **SSEN Transmission**
  - **What it does**: Owns, operates and maintains the electricity transmission network in the north of Scotland.
  - **How it supports net zero**: Connecting sources of renewable electricity generation to the national grid and transporting that clean electricity to areas of demand.
  - **3.8 million** Homes and businesses supplied by SSEN Distribution

### Providing energy solutions

- **SSEN Distribution**
  - **What it does**: Owns, operates and maintains the electricity distribution networks in the North of Scotland and central southern England.
  - **How it supports net zero**: Through the timely connection of local renewables and the co-ordinated delivery of network investment and flexible solutions to alleviate network constraints and allow for further electrification.
  - **c.1.2 million** Domestic and business customer accounts

- **Customers**
  - **What it does**: SSE Business Energy and SSE Airtricity provide energy and related services to households, businesses and public sector organisations across Great Britain and the island of Ireland.
  - **How it supports net zero**: Increases the accessibility of green energy solutions through the provision of customer-driven propositions and acts as a partner to customers and stakeholders as they seek ways to respond to the climate crisis.
  - **380MW** solar and battery pipeline secured with >1GW more sites under assessment

- **Distributed Energy**
  - **What it does**: Focused on investing in, building and connecting localised flexible energy infrastructure, as well as developing solar and battery projects, operating heat networks, and offering integration, aggregation and trading capability.
  - **How it supports net zero**: Through offering services that bring low-carbon, on-site generation, storage and delivery flexibility close to the point of use. Diverse capabilities across a range of low-carbon technologies offer a local ‘whole system’ approach.

---

* Based on equity share at 31 March 2022  
** Following the sale of its Contracting arm, SSE Enterprise is now referred to as Distributed Energy
Embedding sustainability

SSE’s approach to sustainability

A sustainable strategy

SSE does not have a separate sustainability strategy, rather it works to integrate the principles of long-term social and environmental sustainability within its business strategy. Driven by the stated objective to “create value for shareholders and society” established in its business strategy, since 2019, the United Nations Sustainable Development Goals (SDGs) have provided the framework to guide the creation of that shared value. In January 2022, the SSE Board reaffirmed its commitment to the SDGs supporting SSE in delivering sustainable outcomes.

The UN’s Global Goals is a powerful framework for SSE, as it represents a consensus of the priorities in achieving global sustainable development. The 17 SDGs and their 69 sub targets are as important for businesses and other sub state actors to contribute, as it is for national governments. SSE takes inspiration from those goals and sub targets, disclosing its commitment to the SDGs supporting SSE in delivering sustainability within its business strategy. Driven by SSE’s strategy “…creating value for shareholders and society…”

Confirming strategic materiality

Any effective approach to sustainability must be underpinned by an analysis of the social, environmental, and economic issues that are most relevant and important in the context of SSE’s business activities. While an assessment of materiality is something that is constantly under review, the operating context of the urgency to tackle climate change, the Russian invasion of Ukraine and its impact on global energy prices simply reinforced the salience of the most material SDGs identified in 2019.

Highly material SDGs

In March 2022 the Safety, Sustainability, Health and Environment Advisory Committee reconfirmed four highly material SDGs as being:

- Climate action
- Responsible consumption and production
- Affordable and clean energy
- Industry, innovation, and infrastructure
- Decent work and economic growth

Material SDGs

Furthermore, a review of SSE’s environmental impacts in March 2022, led to the identification of three further SDGs where SSE makes a material impact. These material SDGs guide the pillars of SSE’s developing environment strategy and are:

- Reduce carbon intensity by 80%
- Increase renewable energy output fivefold
- Enable low-carbon generation and demand

The strategic hierarchy of Sustainability within SSE

While the breadth and depth of SSE’s economic, social and environmental is extensive and complex, a strategic hierarchy of sustainability provides simplification and clarity.

Driven by SSE’s strategy “...creating value for shareholders and society...”

Aligned to shared value global framework United Nations Sustainable Development Goals (SDGs)

SSE’s 2030 Goals

Four highly material SDGs linked to SSE’S 2030 Goals

- Cut carbon intensity by 80%
- Increase renewable energy output fivefold
- Enable low-carbon generation and demand
- Champion a fair and just energy transition

Three further material SDGs linked to SSE’s Environmental Strategy Environmental management and governance

- Resource use
- Natural environment

“...it is impossible to be sustainable without tackling climate change. It is, however, possible to tackle climate change in a way that is unsustainable for people and nature. That is why SSE’s approach to sustainability, while putting climate mitigation first, places social and environmental issues at the core of its approach too."

Rachel McIwen, Chief Sustainability Officer
Embedding sustainability

Stretching SSE’s 2030 business goals

SSE’s 2030 business goals, aligned to the four highly material SDGs, were also established in 2019. A review in 2021/22 reflected on the significant progress made by SSE against the original ambitions at the same time as recognising the impetus for accelerated climate action in the UK and beyond. It also recognised the opportunity for greater specificity, particularly in relation to expected customer requirements on electricity networks. As a result, the Board agreed in January 2022 to upweight those business goals, and by doing so ensuring that SSE’s medium-term plans better reflect climate science, the ambitions of governments and SSE’s accelerated five-year investment plan.

**Goals set in 2019**

- Cut carbon intensity by 50%*
  - Reduce the carbon intensity of electricity generated by 50% by 2030, compared to 2018 levels, to around 150gCO₂/kWh.

- Treble renewable energy output
  - Develop and build by 2030 more renewable energy to contribute renewable output of 30TWh a year.

- Help accommodate 10m electric vehicles
  - Build electricity network flexibility and infrastructure that helps accommodate 10 million electric vehicles in GB by 2030.

- Champion Fair Tax and a real living wage
  - Be the leading company in the UK and Ireland championing Fair Tax and a real Living Wage.

**Refreshed Goals in 2022**

- Cut carbon intensity by 80%
  - Reduce Scope 1 carbon intensity by 80% by 2030, compared to 2017/18 levels, to 61gCO₂e/kWh.

- Enable low-carbon generation and demand
  - Enable at least 20GW of renewable generation and facilitate around 2 million EVs and 1 million heat pumps on SSEN’s electricity networks by 2030.

- Champion a fair and just energy transition
  - Be a global leader for the just transition to net zero, with a guarantee of fair work and commitment to paying fair tax and sharing economic value.

- Increase renewable energy output fivefold
  - Build a renewable energy portfolio that generates at least 50TWh of renewable electricity a year by 2030.

* Target was subsequently uprated to a 60% reduction to around 120gCO₂e/kWh in 2020 as a result of SSE’s first set of science-based carbon targets, at the time, aligned to a ‘well-below 2°C pathway’.

---

*SSE plc Sustainability Report 2022*
Embedding sustainability

Structured sustainability governance

The structures governing sustainability within SSE are designed to deliver clear lines of accountability and ensure the alignment of strategic objectives with social and environmental value.

The good governance of sustainability issues helps to improve SSE’s overall business performance. It manages social and environmental risks — but perhaps more impactfully — it can unlock opportunity for enhanced value too.”

Helen Mahy CBBC, Chair, SSE EAC

The Board and its sub-Committees
During 2021/22, the Board reviewed and approved SSE’s Group Policies, including specific policy statements on human rights, the environment, climate change and sustainability. The Board also approves, annually, SSE’s priorities relating to its principal sustainability impacts, of which, climate change is defined as the most material of all. In November 2021 the Board approved a set of revised greenhouse gas emissions targets aligned to a 1.5°C warming pathway and verified by the Science Based Targets initiative. In March 2022 the Board also reviewed and approved SSE’s ‘Net Zero Transition Plan’.

The Board is advised on matters relating to safety, health and the environment by the Safety, Sustainability, Health and Environment Advisory Committee (SSHEAC), which continues to be chaired by an independent non-Executive Director. In 2021/22 the SSHEAC reviewed SSE’s climate adaptation plans, assessed SSE’s relative performance in ESG surveys and approved the 2021/22 Sustainability Report.

The Remuneration Committee is also chaired by an independent non-Executive Director of the Board. Its remit includes preparing SSE’s policy on executive remuneration for the approval of shareholders and assessing Executive Directors’ performance in relation to short and long term incentives. This includes assessing progress towards SSE’s four business goals for 2030 which are aligned to the UN’s SDGs. 2021/22 is the third time the Directors have been assessed against these criteria, see pages 80 to 83 for more information. The Remuneration Committee has undertaken its three-yearly review of its Remuneration Policy through 2021/22 and subject to shareholder approval, sustainability metrics will now be embedded within the long term incentive plan, in addition to the Annual Incentive Plan.

From 2021/22, and as a result of a new obligation to report against the Task Force on Climate-related Financial Disclosures recommendations, the Audit Committee reviewed the approach to the preparation of the 2022 disclosures in SSE’s Annual Report, and approved the TCFD report on pages 42 to 55 of SSE’s Annual Report 2022.

The GEC and its sub-Committees
SSE’s Group Executive Committee (GEC) is responsible for implementing strategy, as approved by the Board, including Group Policies and the management of risks. The GEC agrees priorities relating to SSE’s most material social, environmental, and economic impacts. The Chief Executive chairs the GEC and as Executive Director with responsibility for sustainability, approves the annual objectives and priorities for the Chief Sustainability Officer.

The Group Risk Committee is responsible for managing the processes in place to assess and monitor the Group’s Principal Risks and provides oversight of Business Unit risks. The Human Rights Steering Group, responsible for the production of the annual Modern Slavery Statement, reports to the Group Risk Committee. In 2021/22, the Group Risk Committee also had oversight of the internal process to identify and quantify the most material climate-related risks and opportunities.

The Safety, Health and Environment Subcommittee is responsible for the management of risks. The GEC agrees priorities relating to SSE’s most material social, environmental, and economic impacts. The Chief Executive chairs the GEC and as Executive Director with responsibility for sustainability, approves the annual objectives and priorities for the Chief Sustainability Officer.

The Sustainability Sub-Committee of the SSEPD Board governs the sustainability strategies of both SSE Distribution and SSE Transmission comprising of one independent non-Executive Director, the Group Chief Sustainability Officer and Executives from each of the respective businesses. In 2021/22 the Committee reviewed and had oversight of the sustainability strategy contained within the SSE Distribution ED2 draft business plan.

Chief Sustainability Officer
The role of Chief Sustainability Officer (CSO) was established in 2019, reporting directly to the Chief Executive and is responsible for advising on sustainability issues and strategy. To support the integration of sustainability within the governance structures of SSE, the CSO is a member of the SSHEAC and three of the four Group-level sub-Committees of the GEC: the Risk Committee, from June 2022, the Large Capital Projects Committee and the Safety, Health and Environment Committee; and is also a non-Executive Director of the SSEPD Board and its Sustainability sub-Committee.

SSE plc approach to business ethics
SSE has well established processes and procedures to embed a healthy business culture at all levels of its organisation, supporting employees to adopt the right values, and empowering them to speak up against wrongdoing. SSE has robust labour standards to ensure those who work for the company, either directly or on its behalf through its supply chain, are treated fairly and with dignity and respect. More information on its approach can be found on pages 62 to 63 of SSE’s Annual Report 2022 and covers:

• SSE’s Doing The Right Thing employee guide to good business ethics.
• Reporting and investigating wrongdoing.
• Upholding robust labour standards.
• Targeting potential human rights violations and modern slavery risk.
Identifying the issues that matter

SSE considers issues material if they have the potential to have significant impact on its operations or its stakeholders, either positively or negatively.

The integrity of an organisation’s approach to long term sustainability depends upon its ability to identify the social and environmental risks and opportunities that matter. Those issues may matter to the success of the organisation or to the organisation’s stakeholders. This process of considering what is important and to whom is one that is constant and continuous for SSE. It is also a process SSE believes can always be improved upon.

Most importantly, ongoing materiality assessments require an analysis of emerging social, economic and environmental trends, a structured approach to stakeholder engagement, the nurturing of long-term partnership, and a sophisticated understanding of the principal risks facing SSE.
Emerging trends

An organisation’s long-term sustainability is, in part, determined by its ability to identify and respond to key and emerging trends in its external environment. In 2021/22, the case for enhancing future social and environmental value was given greater impetus in the recovery from the coronavirus pandemic, global efforts to combat climate change and the macroeconomic impact of rising prices constraining economic growth and causing hardship for many.

Urgent messaging from climate science

The Intergovernmental Panel on Climate Change (IPCC) prepares comprehensive assessments of climate change every five to seven years. Its Sixth Assessment reports were published in 2021 and 2022, with increasingly urgent tones on the immediacy of the climate challenge.

The first report summarised the physical science of climate change and concluded that it is unequivocal that human behaviour has warmed the planet, causing widespread and rapid changes to the Earth’s oceans, ice, and land surface. This second report recognises that climate change poses a threat to human well-being and the health of the planet and that whilst adaptation efforts have been observed across all sectors and regions, progress is uneven, fragmented, small in scale and incremental.

The third report advises policymakers how to meet net zero and onwards its findings were that drastic changes are needed to phase out global dependence on fossil fuels.

It is clear from the science that time is running out to prevent the most dangerous climate change (more than 1.5°C warming above pre-industrial levels). The final synthesis report of the Sixth Assessment is expected in September 2022 and will provide the conclusion to the entire Sixth Assessment cycle with guidance and advice for policy makers in advance of COP27 in Egypt. SSE continues to pay very close attention to emerging climate science considering the implications of that science on its business activities.

“A shift to renewables will mend our broken global energy mix and offer hope to millions of people suffering climate impacts today. Climate promises and plans must be turned into reality and action. Now. It is time to stop burning our planet and start investing in the abundant renewable energy all around us.”

Antonio Guterres, UN General Secretary, 4 April 2022 on the publication of the IPCC Sixth Assessment Working Group III Report.

The emerging consensus on standardised ESG metrics

After years of debate about the importance of common, international standards on sustainability metrics and criteria, consensus emerged in 2021. Announcements at COP26 include the establishment of and International Sustainability Standards Board (ISSB) to develop, in the public interest, a comprehensive global baseline on high-quality sustainability disclosure standards to meet investors’ information needs.

Incorporating existing frameworks such as CDP and the SASB Standards, the announcement was welcomed by the G20, the Financial Stability Board, the World Economic Forum amongst others. Furthermore, UK Chancellor Rishi Sunak announced in October a sustainable finance roadmap for the UK. With enhanced disclosure requirements for businesses on their environmental impacts and a UK taxonomy providing a rule book for the classification of environmental economic activity, further detail on the implementation of the plan is expected in 2022.

Having made comprehensive environmental and social disclosures on a voluntary basis for many years, SSE looks forward to greater standardisation in the future, as the basis for high quality stewardship engagement with its investors and shareholders.

“We want sustainability to be a key component of investment decisions, and our plans will arm investors with the right information to make more environmentally-led decisions.”

Rishi Sunak, UK Chancellor, 18 October 2021

Developing a framework to value nature

Inspired by the impact of the Task Force on Climate-related Financial Disclosure, and the importance of nature in restoring the planet back to balance, progress is being made in establishing a framework for valuing and disclosing nature impacts. The Taskforce on Nature-related Financial Disclosures (TNFD) published the first version of its nature-related risk management and disclosure framework. The TNFD seeks to create a risk management and disclosure framework for organisations to report and act on evolving nature-related risks, ensuring nature is factored into financial and business decisions.

This first version of the TNFD framework includes disclosure recommendations and practical guidance on nature-related risk and opportunity analysis. Disclosure recommendations have been closely aligned with the TCFD recommendations, with the intention to focus on climate adaptation. TNFD is now undertaking an 18-month consultation process on the framework, with several beta versions published ahead of the final recommendations in September 2023.

SSE believes that the ability to quantify and articulate its impacts on nature is an important area for development in the years to come. It will continue to work, at a business level, on practical activities that support both the transparency of its impacts and the methods in which it can enhance value to nature.

“Truly sustainable economic growth and development means recognising that our long-term prosperity relies on rebalancing our demand of Nature’s goods and services with its capacity to supply them.”

Professor Sir Partha Dasgupta, February 2021.
SUSTAINABILITY REPORT

Identifying material issues

Working with and for stakeholders

The essential nature of SSE’s core product, energy, means there is a wide range of stakeholders who have a direct interest in SSE and whose perspectives must be considered if it is to achieve its business objectives.

SSE’s approach to stakeholder engagement

SSE understands there is an effective social contract between the company and the society within which it operates. At the core of that contract is a reciprocal relationship between SSE and its stakeholders, with SSE relying on a range of inputs, in return for which value is generated and shared.

SSE interacts with a vast array of stakeholders every single day. Its approach to stakeholder engagement seeks to ensure that stakeholder perspectives are built into its business plans and objectives every step of the way, from project planning, project delivery and onwards through long-term operations and customer service. It therefore promotes an open and transparent approach to stakeholder engagement which is supported by accountability at both Group and Business Unit level. SSE adopts a range of engagement methods to build those reciprocal relationships. These methods exist in a strategic framework that is a combination of business-led and Board level engagement. Details of engagement methods deployed, and the material issues raised are outlined on pages 34 to 39 of the SSE Annual Report 2022.

SSE’s key stakeholder groups

SSE defines its stakeholders as the people, communities and organisations with an interest in SSE’s purpose, strategy, operations and actions and who may be affected by them. In 2021/22 the SSE Board, reconfirmed the six principal stakeholder groups, outlined below, within that context.

- Employees
- Shareholders and debt providers
- NGO, communities and civil society
- Energy customers
- Suppliers, contractors and partners

Partnerships that power change

Working with key partners enables SSE to drive progress by collaborating with leaders and specialists to achieve more than it could alone. Partnerships encourage knowledge sharing that enables SSE to set ambitious targets, keeps it accountable and contribute to sustainability agendas beyond its own operations. SSE appreciates the support of its partners to drive improvements and increase SSE’s visibility of the challenges affecting the industry and its supply chain. SSE’s partnerships form a core part of the business, and have done for a number of years, helping SSE navigate new areas of focus as the scope of the business expands, and ensures it is preparing for the future.

Long standing values-based partnerships

SSE has worked with a number of partners for many years, which form a core part of SSE’s culture and help set standards for the way SSE operates.

- Living Wage Foundation: SSE firmly supports the principles and values promoted by the Living Wage Foundation and seeks to support both the Foundation and the wider business community increase the number of working people earn at least a real Living Wage. SSE has been an accredited Living Wage employer since 2013. Furthermore, SSE became a living hours employer in March 2021. For more information see page 60 of SSE’s Annual Report 2022.
- Fair Tax Foundation: As the first FTSE100 company to achieve Fair Tax accreditation in 2014, SSE has consistently supported the Fair Tax Foundation to establish a culture of pride amongst businesses making a fair contribution in the support of public services. SSE has achieved Fair Tax Mark accreditation for eight consecutive years. For more information on SSE’s tax disclosure see page 70.
- United Nations Global Compact (UNGC): SSE has been a signatory of the UNGC since 2018 and aligns to its ten principles for corporate sustainability. For more information see sse.com/sustainability/partnerships-and-memberships/.
- Institute of Business Ethics (IBE): IBE promotes the highest standards of ethical business conduct, providing its subscriber companies with a wealth of resources in implementing ethical business practices. SSE has been a subscriber since 2014 and regularly participates in events and industry working groups to share best practice on embedding ethical business cultures.

Driving potential for SSE and wider industry

As SSE’s business evolves, partnerships are essential for uncovering new areas of focus and increasing standards for the business, driving awareness of additional requirements that SSE must consider, and enabling SSE to be part of the discussions around emerging industry challenges and how to solve them. Recently SSE has been working with a number of partners that increase its reach and shape its thinking.

- Accounting for Sustainability: through SSE’s Chief Financial Officer, SSE has been a member of the Prince of Wales’ Accounting for Sustainability Network since its inception in 2013. The partnership with AAS and its network of finance leaders has been key in supporting SSE’s efforts for enhanced quantification and disclosure of its material social and environmental impacts.
- Business in the community Ireland (BITCI): BITCI is the foremost organisation in the Republic of Ireland promoting sustainability and responsible business practices. SSE is an active member and achieved the Business Working Responsibly Mark for the first time in 2017.
- Supply Chain Sustainability School: SSE has been a principal partner with the school since 2021 and is a member of a number of working groups relating to labour standards, infrastructure, carbon, and more. SSE has worked with the school to engage with its employees by delivering bespoke training programmes and workshops, as well as collaborate closer with its suppliers.

Many further business partnerships exist across SSE’s business units and SSE is grateful to those organisations for their input and contribution.
Identifying material issues

SSE’s Group Principal Risks

The execution of SSE’s strategy and delivery of its purpose is dependent on the effective identification, understanding and mitigation of the Group’s Principal Risks.

Sustainability in the Group Principal Risk context

Whilst all the Group Principal Risks are relevant to the sustainable development of SSE, those with particular significance to social and environmental impacts are outlined below. More information can be found in SSE’s Group Principal Risk report and SSE’s Annual Report 2022, pages 68 to 81, which detail key developments during the year and key mitigations SSE has in place.

CLIMATE CHANGE

The risk that SSE’s strategy, investments or operations are deemed to have an unacceptable future impact on the natural environment and on national and international targets to tackle climate change.

The physical impacts of climate change, such as severe weather that can interrupt energy supply or generation, and the transitional risks relating to developments in political and regulatory requirements on the products and services SSE provides, have potential to impact SSE’s operations. SSE’s work to reduce its impact on climate change and the consideration of longer-term key climate-related risks and opportunities is detailed on pages 21 and 33.

ENERGY AFFORDABILITY

The risk that energy customers’ ability to meet the costs of providing energy, or their ability to access energy services is limited, giving rise to negative political or regulatory intervention that has an impact on SSE’s core regulated Networks and Renewables businesses.

SSE seeks to support the transition to net zero through disciplined investment in developing and operating low-carbon energy infrastructure, and delivering this in a way that represents value for money for energy customers. It works to ensure that the energy it supplies to customers is not only affordable but is accessible too, and it strives to offer services that are inclusive to all. See pages 38 to 43.

PEOPLE AND CULTURE

The risk that SSE is unable to attract, develop and retain an appropriately skilled, diverse and responsible workforce and leadership team, and maintain a healthy business culture which encourages and supports ethical behaviours and decision-making.

An ethical business culture alongside the talent and skills of SSE’s employees enable it to fulfil its purpose and achieve its strategic goals. SSE has a long-standing commitment to fair and decent work and seeks to provide an inclusive, fulfilling and high-performing workplace. SSE’s responsible approach to attracting, developing and retaining a future skilled workforce is detailed on pages 76 to 83.

LARGE CAPITAL PROJECTS MANAGEMENT

The risk that SSE develops and builds major assets that do not realise intended benefits or meet the quality standards required to support economic lives of typically 25 to 60 years within forecast timescales and budgets.

SSE’s investment in large infrastructure projects can have considerable social, economic and environmental consequences. To deliver high-quality projects, SSE works closely with suppliers and contractors to ensure its values on issues such as environmental protection, modern slavery and fair pay are upheld. SSE’s work to promote and embed sustainability within its supply chain is detailed on pages 53 to 55.

POLITICS, REGULATION AND COMPLIANCE

The risk from changes in obligations arising from operating in markets which are subject to a high degree of regulatory, legislative and political intervention and uncertainty.

SSE aims to work constructively with governments and regulators to help deliver net zero, whilst ensuring the energy system works in the interest of energy customers. SSE’s activities are influenced by international and national agreements on climate change, and sustainability issues are increasingly included in regulatory and legislative requirements. See page 28.

SAFETY AND THE ENVIRONMENT

The risk of harm to people, property or the environment from SSE’s operations.

SSE has an uncompromising commitment to keep people safe and healthy, and to respect the environment in which it operates. SSE’s working environment includes challenging geographic locations and adverse weather conditions, which can impact its activities. It has clear safety and environmental processes and training in place to address these risks. SSE’s safety, health and environment performance and initiatives are detailed on pages 84 to 97.

Climate related opportunities and risks

With climate change raising both risks and opportunities over the longer term, SSE’s approach to meeting the Task Force on Climate-related Financial Disclosures has been designed to complement the process to identify and mitigate SSE’s Group Principal Risks.

Mandated climate-related financial disclosures in the UK

While SSE has voluntarily disclosed against the TCFD recommendations since 2018, in 2021/22 it is now mandatory for premium listed companies to report on a ‘comply or explain’ basis.

SSE’s TCFD report is outlined in its Annual Report 2022 between pages 42 and 55. The report represents the culmination of an enhanced governance and assurance process and represents the most fulsome assessment of the impact of climate change on SSE in the medium to long term.

With four pillars to the TCFD recommendations, and 11 recommended disclosures, the TCFD framework is designed to ensure that climate issues are factored into long term decision making. SSE has fully met 10/11 of the recommended disclosures. The remaining recommendation, under Strategy 2.6, has been partially met with plans to meet it in full in 2022/23.

SSE further believes there is an opportunity for increasing maturity of all TCFD disclosures and will actively seek feedback from shareholders and other stakeholders to ensure its disclosures remain appropriate and comparable.

Summary of SSE’s TCFD compliance

A summary of SSE’s compliance and progress in 2021/22 is provided below.

Managing climate-related opportunities and risks

The purpose of the process to identify the most material climate-related risks and opportunities is to support their effective management. The five opportunities outlined represent the core of SSE’s investment strategy with detailed plans to exploit those opportunities detailed within SSE’s Net Zero Acceleration Programme. The four identified risks are managed and controlled closely.

Full details of the controls and mitigations employed by SSE are outlined within its comprehensive annual submission to CDP, made available at sse.com/sustainability.
Accelerating climate action

Increased climate ambitions and a clear plan of action for delivery are paving the way for SSE to drive accelerated action towards net zero.

SSE recognises the serious threat that climate change poses to the natural world and, therefore, to people and the economy. Despite the progress made in the climate negotiations at COP26 in Glasgow in November 2021, continuing evidence published by the Intergovernmental Panel on Climate Change presents an urgent and alarming picture. It continues to be clear that stronger action is needed by governments and business to support an accelerated delivery of net zero. This presents an opportunity for SSE to provide a clean and resilient energy system which is focused on supporting a transition that creates and shares value with shareholders and society.

Cut carbon intensity by 80%
Reduce Scope 1 carbon intensity by 80% by 2030, compared to 2017/18 levels, to 61gCO₂e/kWh.

SSE’s scope 1 GHG emissions intensity increased slightly between 2020/21 and 2021/22, however it has decreased 16% from the 2017/18 baseline.

Despite SSE’s scope 1 emissions falling by 19% compared to 2005/06, and being the lowest since SSE’s records began, SSE’s scope 1 intensity increased slightly by 1% to 256gCO₂e/kWh in 2021/22, compared to 256gCO₂e/kWh in the previous year. Good progress was made in renewables growth and paving a way forward for low-carbon thermal generation. Plans progressed in the development of two new thermal power stations equipped with carbon capture technology, with both projects moving forward in the UK Government’s process to support the most competitive carbon capture plants in pursuit of net zero ambitions.

Our progress
Reduction in GHG emissions from electricity generation 19%
GHG emissions from electricity generation 5.75 MtCO₂e

(B) This data was subject to external independent assurance in 2021. For the limited assurance opinion see page 102.

2020/21 data has been slightly revised after finalisation of data for the August 2020 and 2021 submissions to Ofgem regulatory reporting pack.

1 2021/22 data may be subject to minor adjustment before final inclusion in the regulatory reporting pack published to Ofgem in August 2022. Some 2019/20 data was subject to independent assurance.

A strategy to support net zero

SSE’s business strategy has the transition to net zero at its core and SSE has a well-established decarbonisation plan which continues to deliver progress against stretching climate ambitions.

Stretching net zero ambitions

SSE made a clear public commitment in 2020 to the long-term goal of achieving net zero greenhouse gas (GHG) emissions across all its operations by 2050 at the latest, covering scope 1, 2 and 3 GHG emissions. Recognising the national and international importance of decarbonising the power sector as quickly as possible, in 2021/22, SSE revised this ambition and is now targeting net zero across scope 1 and 2 emissions by 2040 at the latest (subject to security of supply requirements) and for remaining scope 3 emissions by 2050 at the latest.

SSE’s long-term net zero ambitions are supported by a series of interim targets approved by the Science Based Targets Initiative (SBTi). These targets are aligned to the Paris Agreement and a SBTi pathway, and meet the strict SBTi criteria which requires that they cover scope 1, 2 and 3 GHG emissions (see pages 26 to 27 on target progress).

SSE’s two economically regulated businesses, SSE’s Transmission and SSE Distribution, as part of their respective business plans, have set their own science-based greenhouse gas emission targets. To achieve these targets, these regulatory businesses have outlined the actions that they need to take. These targets and actions, which are outlined throughout this Net Zero Transition Plan, deliver GHG emission reductions and contribute to SSE’s overall net zero ambitions.

Progress on the Net Zero Transition Plan

At SSE’s Annual General Meeting in July 2021, SSE established a framework for annual shareholder advisory votes which involved committing to net zero in addition to publishing a Net Zero Transition Report to disclose progress towards net zero.

In March 2022, SSE published its Net Zero Transition Plan which details the targets and actions SSE intends to take to achieve its net zero ambitions. SSE’s Net Zero Transition Report summarises the progress against this plan towards SSE’s net zero targets and should be viewed alongside SSE’s Annual Report 2022, Sustainability Report 2022 and SSE’s CDP Climate Change disclosures. All reports are available at sse.com/sustainability.

Reducing GHG emissions

Between 2017/18 and 2021/22 SSE’s total GHG emissions (scope 1, 2 and 3) have fallen by 35%, from 15.2MtCO2e to 9.9MtCO2e. The fall in GHG emissions across all three scopes is predominantly a result of the change in generation mix of SSE’s thermal generation plant from which GHG emissions contribute 99% of scope 1 emissions.

SSE’s GHG emissions by scopes between 2017/18 and 2021/22

In March 2022, SSE published its Net Zero Transition Plan which details the targets and actions SSE intends to take to achieve its net zero ambitions. SSE’s Net Zero Transition Report summarises the progress against this plan towards SSE’s net zero targets and should be viewed alongside SSE’s Annual Report 2022, Sustainability Report 2022 and SSE’s CDP Climate Change disclosures. All reports are available at sse.com/sustainability.

Reducing GHG emissions

Between 2017/18 and 2021/22 SSE’s total GHG emissions (scope 1, 2 and 3) have fallen by 35%, from 15.2MtCO2e to 9.9MtCO2e. The fall in GHG emissions across all three scopes is predominantly a result of the change in generation mix of SSE’s thermal generation plant from which GHG emissions contribute 99% of scope 1 emissions.
Progress from baseline

Scope 1 GHG intensity has fallen from 307gCO2e/kWh in 2017/18 to 259gCO2e/kWh in 2021/22 – a fall of 16%. This is due to a combination of factors, including a reduction in thermal generation output alongside the change in the thermal generation fuel mix, as well as the increase in the contribution of renewable generation output over this period.

Progress from baseline

SSE’s scope 1 and 2 GHG emissions have fallen by 44% from 11.07 MtCO2e in 2017/18 to 6.24 MtCO2e in 2021/22, largely as a result of lower output from thermal power stations and the closure of SSE’s last coal-fired power plant in March 2020 which has led to a reduction in generation emissions as well as energy consumption in SSE’s thermal power stations.

Performance against the Net Zero Transition Plan

To drive improved performance, SSE measures and reports progress against stretching targets that are science-based and aligned to the ambitions set out in the Paris Agreement.

Short term (to 2025)

- Engage with 50% of suppliers by spend to set an SBT by 2024.
- Reduce the carbon intensity of scope 1 GHG emissions by 80% by 2030, from 2017/18 baseline.

Medium term (2025 - 2035)

- Reduce absolute scope 1 and 2 GHG emissions by 72.5% by 2030 from a 2017/18 base year.
- Reduce absolute GHG emissions from use of products sold by 50% by 2034 from a 2017/18 base year.

Long term (2035 - 2050)

- Net zero for SSE’s scope 1 and 2 emissions by 2040.
- Net zero for all SSE’s remaining scope 3 emissions by 2050.

2025

- Target achievement 96% towards achieving its supplier engagement target.
- Target achievement 20% towards achieving its scope 1 GHG intensity reduction target.

2035

- Target achievement 60% towards achieving its scope 1 and 2 absolute GHG emissions reduction target.
- Target achievement 19% towards its target to reduce GHG emissions from gas sold to customers.

2050

- Target achievement towards achieving its target to engage with 50% of suppliers by spend.
- Target achievement towards achieving its scope 1 GHG intensity reduction target.
Accelerating climate action

Embedding climate action

SUSTAINABILITY REPORT

Accelerating climate action

SSE works to embed policies and processes that support the delivery of climate action in line with clear principles aligned to the Paris Agreement and a 1.5°C pathway.

Advocating for accelerated climate policy
During 2021/22, SSE continued to advocate for accelerated climate action with a focus on increasing deployment of renewable generation and decarbonisation of thermal generation, heat and transport. Specific activity included:

Addressing barriers to offshore wind deployment: SSE Renewables has long advocated for the UK Government to set more ambitious renewable buildout targets and streamline the planning process for offshore wind through the Offshore Wind Acceleration Task Force. In 2022, it was pleased to see the UK Government confirm targets in the British Energy Security Strategy for 5GW of offshore wind by 2030, including 5GW floating offshore wind, with a commitment to significantly cut consent time down to one year.

Making the case for pumped storage: through its membership of the Long Duration Electricity Storage Alliance, SSE Renewables engaged with the UK Government’s Energy Minister to advocate for bespoke policy mechanisms that support the deployment of renewable energy storage technologies and enable the UK to meet its net zero commitments.

Increasing support for lower-carbon technologies: over 2021/22, SSE Thermal contributed to key UK Government consultations, including the development of a UK Low Carbon Hydrogen Standard, a Hydrogen Production Business Model and a Power-Carbon Capture and Storage (CCS) Business Model. It advocated for frameworks to establish carbon dioxide transport and storage networks across the UK and low-carbon hydrogen value chains, with the potential to progress to a 100% hydrogen-fuelled power generation sector, supported by hydrogen storage.

Working with its CCS trade association, it contributed to a cross-sector Carbon Capture, utilisation and storage (CCUS) 2035 Delivery Plan, setting out the pathway needed to abate 50 million tonnes of CO₂ per year by 2035.

Unlocking the north of Scotland’s net zero contribution: in November 2021, SSE’s Transmission published an analysis highlighting the significant contribution the north of Scotland will make to UK and Scottish Government net zero targets and advocated for the UK Government to introduce a national strategic plan that sets out the necessary investment in the UK transmission system to achieve a fully decarbonised electricity sector by 2035.

Advocating for clean, flexible and affordable energy
The decarbonisation of electricity systems needs to be managed in a responsible and phased way to meet the challenges of energy security, affordability and net zero commitments. This was evidenced in 2021/22, when SSE’s scope 1 GHG emissions intensity increased slightly. The main reason for this was the increased demand for more carbon intensive oil-fuelled peaking plant in Ireland that arose due to the need to balance the electricity grid. To address this, SSE has been advocating for policy mechanisms that support the deployment of renewable technologies that provide flexibility as well as planning frameworks that deliver accelerated offshore wind development. For instance, policy interventions such as the Maritime Area Planning Act in the Republic of Ireland enable the rapid deployment of offshore wind which in turn decreases dependency on expensive and carbon intensive oil-fuelled peaking plant.

Taking account of the price of carbon
As a generator of electricity, SSE is subject to policies that impact the price of carbon, which means the price of carbon is an explicit consideration in many investment decisions.

During 2021/22, SSE’s generation activities in GB operated under the new UK Emissions Trading Scheme (UK ETS) carbon pricing system, which came into operation to replace the EU ETS following Brexit. The UK ETS is a cap-and-trade emissions scheme similar in design and aims to the EU ETS. SSE’s activities are subject to the Carbon Price Support (CPS) mechanism which sets a price per tonne of carbon emitted and combined with the UK ETS allowance price, makes up the Total Carbon Price paid by electricity generators.

The combination of the UK ETS and the CPS sets the carbon price in electricity market in Great Britain, and the EU ETS in the Single Electricity Market (SEM) between Ireland and Northern Ireland.

SSE views that a robust carbon price in the electricity system has a critical role in meeting the UK’s net zero commitments, and delivering a net zero electricity system in the 2030s. SSE continues to promote a robust carbon price with the UK and Irish Governments, along with the European Commission, and supported the strengthening of the UK and EU’s 2030 ambition ahead of COP26 which directly impacts the UK ETS and EU ETS through determining the supply of greenhouse gas emission allowances. Ultimately, SSE believes the progressive tightening of the allowances available is a powerful tool to reduce greenhouse gas emissions in the most economic way possible. SSE will also continue to actively engage with both the UK and EU as they implement the changes to align their ETS with their net zero targets as soon as possible, both bilaterally and through its trade associations.

Climate alignment of trade association membership
SSE is a member of number of diverse trade associations that align with its business objectives and enable it to work collaboratively across the energy sector on matters of shared interest. SSE works closely and engages with these trade associations on a continuous basis to ensure that their principles on climate change are consistent with those of its own.

In December 2021, SSE published the first annual review of its trade association memberships in relation to its net zero ambitions and the goals of the Paris Agreement. The results showed that, of the 20 trade associations considered within scope, 19 were aligned overall and one was partially aligned. None of the trade associations assessed were identified to have opposing climate-related views. SSE will continue to engage with all trade associations that were found to be aligned and will undertake a process to seek increased engagement where partial alignment was identified, with results of action taken to be disclosed in the next annual review later in 2022. More information can be found in SSE’s Trade Association Climate Review available at sse.com/sustainability.

“SSE’s Net Zero Transition Plan not only sets robust, scientific carbon targets and spells out the actions that are required to meet them, it seeks to be open and transparent about the challenges we expect to face too. For a company with a social responsibility to provide homes and businesses with and essential product – it is vital that we do so.”

Martin Pibworth
Chief Commercial Officer

DILEMMA

SSE plc Sustainability Report 2022

SSE plc Sustainability Report 2022
Targeted action to address GHG emissions

SSE’s Net Zero Transition Plan sets out a clear plan of action it will take to accelerate clean energy development alongside reducing emissions from thermal sources of electricity generation. A clear plan of action for net zero

SSE understands that credible net zero targets must be backed up by a clear plan of actions that will be taken to achieve them. SSE’s Net Zero Transition Plan was designed to provide this clarity for its stakeholders, outlining in detail 14 key actions it will take to ensure its net zero ambitions are met.

The key actions focus primarily on addressing SSE’s largest source of GHG emissions from electricity generation, alongside a plan to address remaining GHG emissions across all scopes. This section provides updates on some of the actions taken for the key scopes of emissions for SSE’s scope 1, 2 and 3 GHG emissions, with further information provided throughout this report.

### Key progress in 2021/22

GHG emissions from SSE’s electricity generation fell by 19% between 2020/21 and 2021/22, and were the lowest since SSE’s records began.

- **SSE Thermal**: proceeded with plans for the development of two new power stations equipped with carbon capture technology, with both projects moving forward to differing degrees in the UK Government’s process to encourage and support competitive carbon capture plants.
- **SSE continued to advocate for increased support for lower-carbon thermal generation technologies.**
- **SSE showed its support for Direct Air Capture and Storage (DAC) in the UK Government’s proposed Scottish Cluster and submitted evidence on negative emissions technologies to the UK Environmental Audit Committee.**
- **SSE made good progress on key renewables projects and at 31 March 2022 it had 2.6GW of capacity in construction**

SSEN Transmission progressed further with trials of SF6 alternatives at its substations, including the first substation with SF6-free Siemens Energy Clean Air Voltage Transformers. SSEN Distribution published its enhanced SF6 leakage reduction strategy as part of its RHI-ED2 Business Plan.

SSEN Distribution’s new RHO-ED2 business plan outlines its commitment to produce a diesel strategy to transition away from carbon-intensive fuels on the Scottish Islands.

SSE made good progress towards its EV100 commitment with over 40% of its car fleet now fully electric and it increased its fully electric van fleet from 12 to 41.

### SCOPE 2

- **Reduce electrical losses from SSEN Distribution**
- **Deliver a net zero property estate**

### SCOPE 3

- **Support customers to fuel switch and consume less gas**
- **Advocate for a pathway for decarbonised heat**
- **Establish a framework for supplier collaboration on net zero action**
- **Partner with the CDP supply chain engagement programme**

---

*Based on equity share*
Removing other scope 1 and 2 GHG emissions

Although electricity generation emissions are the most significant GHG emission source for SSE, it is still important for SSE to reduce other scope 1 and 2 GHG emissions sources. SSE has a set of actions that aim to reduce these emissions. The next largest contributor to SSE’s scope 1 and 2 emissions is losses from the electricity distribution network. These emissions are important because as the network grows to facilitate the connection of renewable electricity generation there will be a corresponding increase in the amount of electricity lost on the network which will result in a rise in electricity losses. Grid decarbonisation will help to lower the impact of emissions from these losses; however, it is important for SSE to continue to invest in methods that limit these losses wherever possible across the network.

A strategy to address losses from electricity distribution networks

At the beginning of the RIIO-ED1 price control period, SSEN Distribution developed its Distribution Losses Strategy for the purpose of identifying key measures to reduce losses across its networks. SSEN Distribution has implemented innovation projects alongside additional measures such as increasing the minimum size of new secondary transformers and switching off underutilised plant during periods of low loading, to ensure that it continues to reduce losses over the remainder of the current RIIO-ED1 price control period.

For the next price control period between 2023 and 2028, SSEN Distribution has updated its Losses Strategy and will focus on further reduction of technical losses across its networks. SSEN Distribution will continue with many of the initiatives set out in RIO-ED1, but will also expand its activities to initiatives such as the introduction of On-Load Tap Changing (OLTC) technology in transformers and setting a minimum cable size of 300mm² in LV, 11kV and 33kV network. It will also work to improve monitoring to understand where actual losses occur to direct intervention measures.

Addressing supplier emissions

SSE has set SBTi-approved targets to engage with 50% of its suppliers by spend to set science-based targets by March 2024. The company is close to meeting this target and is actively engaging with its key suppliers to understand the climate impact of its supply chain activities. The next phase of SSE’s engagement is to measure the impact of its suppliers with the aim of integrating solutions to mitigate and manage these emissions.

Demonstrating leadership in supply chain engagement

SSE has been working with CDP to improve its climate-related supply chain engagement. By requesting information and providing support supplier webinars, SSE suppliers accounting for over 65% of spend provided information to SSE through the CDP Supply Chain module in 2020/21. This was the highest number of responses since SSE began its partnership with CDP in 2018.

This engagement has been recognised by CDP as it awarded SSE an A in its Supplier Engagement Rating assessment in 2022. Over 13,400 companies were assessed, and SSE featured in the top 5%.

Accelerating climate action

Potential impacts of climate change

The increase in severity and regularity of extreme weather events can pose significant disruption to SSE’s operations and it must work to build resilience as it adapts to changing weather patterns.

Adapting to a climate changed world

The increasing severity and regularity of extreme weather events can pose significant disruption to SSE’s operations and it must work to build resilience as it adapts to changing weather patterns.

Future climate models predict that climate change will continue to bring extreme events such as storms, floods and heat waves all of which impact SSE’s businesses. For SSE, boosting weather resilience and assessing climate adaptation requirements is essential to the ongoing resilience of its operations.

In 2022/23, SSE contributed to the electricity generation sector’s third Climate Change Adaptation Report published by Energy UK. This report detailed the measures electricity generators are implementing to keep power stations and other generating technologies operating in the event that more extreme weather events, such as flooding, rising sea levels, drought, extreme temperature and coastal erosion, take place. As part of its resilience planning, SSE assessed the resilience of its high-efficiency gas-fired power station, at Keadby 2, to the risk of flooding and concluded that the project was resilient to future flooding impacts. Overall, assessments like these provide valuable evidence to help government and businesses assess the UK’s resilience to climate change.

DILEMMA

Building resilience to future climate change

Future climate models predict that climate change will continue to bring extreme events such as storms, floods and heat waves all of which impact SSE’s businesses. For SSE, boosting weather resilience and assessing climate adaptation requirements is essential to the ongoing resilience of its operations.

Providing affordable and clean energy

As global energy systems transition away from being largely based on fossil fuels, it is vital that the new renewables-led system is accessible, affordable and reliable for energy consumers.

SSE has an important role in supporting its customers and consumers access affordable and clean energy. From driving down the cost of generating electricity from renewables, providing low-carbon energy solutions and green services to customers, to the careful balancing of consumer interests in electricity networks business plans - SSE’s businesses seek to ensure the transition to net zero represents value for consumers.

Increase renewable output fivefold
Build a renewable energy portfolio that generates at least 50TWh of renewable electricity a year by 2030.

Despite a fall in renewable generation output between 2020/21 and 2021/22, over the year SSE has made good progress on key renewable projects.

SSE Renewables progressed key offshore projects in 2021/22, including reaching financial close on Dogger Bank C and construction progressing at Seagreen and Dogger Bank A and B. At 31 March 2022, SSE had 2.4GW of renewable energy capacity in construction (based on equity share). SSE’s renewable generation output (inc. pumped storage, biomass and constrained off wind in GB) fell by 7% between 2020/21 and 2021/22, from 10.2TWh to 9.5TWh, driven by unfavourable weather conditions over the summer.

Assuming average weather conditions, renewable output is expected to increase in 2022/23, due to the start of production at Seagreen.

Our progress

 Delivering net zero in a cost-effective way

The scale of infrastructure investment needed to deliver net zero requires innovative technology, partnership models and sustainable financing to deliver value for money for all energy consumers.

Reducing reliance on imported gas

Driven by the global price of gas, the cost for energy for homes and business is at historically high levels, causing significant hardship for many families across the UK and Ireland. However, within the next few years, reduced reliance on gas for energy is expected to deliver improved electricity affordability.

Advances in technology and increased scale of wind turbines means that, in 2019, the price of a Contract for Difference (CfD) for offshore wind in the UK was less than £50/MWh, down from around £140/MWh in 2014 (in 2012 prices). While the projects awarded CfDs in 2019 are in development, it has been calculated that if those wind farms had been operating in the winter months of 2021/22, over £7bn of payments would have been made to the CfD scheme administrator, helping to reduce future energy bills for consumers. The expects that the Seagreen wind farm having been developed at place, SSE expects it to contribute 0.9TWh of low-carbon electricity to the GB electricity system in 2022/23, providing a very practical contribution to both the challenges of energy security and energy affordability currently facing the country.

Increasing renewables output

The rapid deployment of renewable energy globally is understood to be the most important short-term action to tackle climate change and now, with the effects of global gas prices on inflation, the case for renewable energy is reinforced further. SSE seeks to make a significant contribution to this challenge of increased renewable deployment.

Significant progress was made in 2021/22 in progressing SSE’s 2030 Goal to increase renewable electricity generation fivefold between 2017/18 and 2030. Construction continues at offshore wind farms Dogger Bank and Seagreen, in addition to onshore developments at Viking on Shetland and Lenaias in Ireland. First power at Seagreen is expected in July 2022 and Lenaias is due to be commissioned in late 2022 or early 2023.

The development of SSE’s pipeline of renewable energy projects continues to be a high priority in ensuring its ambitions are met. SSE’s secured ownership share of an extensive pipeline of projects both home and abroad, totalling over 11GW of future renewable energy capacity.

In its core markets of the UK and Ireland, multiple projects are progressing at once, with a wide range of options being pursued in onshore, offshore, pumped hydro options and – in the longer term – green hydrogen production co-located with wind. SSE’s plans to expand into carefully chosen international markets made important progress with an agreement reached in early 2022 to acquire a renewables development platform in Southern Europe.

While renewable energy output in 2021/22 declined year-on-year as a result of natural wind resources being below normal yearly averages, SSE’s hydro assets played an important role in providing low-carbon flexibility to the GB electricity system. SSE expects renewable output to increase sharply when both Dogger Bank and Seagreen are in full operation.

ENGAGEMENT IN ACTION

Delivering cost effective renewable energy from the north of Scotland

The renewable energy generated in north of Scotland will play a significant role in helping the UK Government achieve its commitment of a fully decarbonised electricity sector by 2035. To achieve this target, the cost-effective transmission of this renewable energy from areas of production to areas of high demand is crucial.

Managed by National Grid, and regulated by Ofgem, Transmission Network Use of System Charging (TNUoS) is a charge to recover the cost of the installation and maintenance of the Gann transmission network. Generally, generators located closer to areas of demand pay less, with those in more remote areas paying more to transmit power onto the system. This results in higher costs for the delivery of renewable projects in the north of Scotland compared to other parts of Britain.

The TNUoS methodology was devised over 30 years ago for a fossil fuel led energy system and SENN Transmission believed it is no longer fit for purpose.

SEEN Transmission has been advocating for the reform of TNUoS and in 2022 it contributed to Ofgem’s TNUoS Call for Evidence Next Steps publication. This publication presented options for potential changes to the current TNUoS charging methodology. SSE hopes that Ofgem’s review will create a clearer view of network charges which will ultimately drive the delivery of vital renewable electricity projects in the most cost-effective way for energy consumers.
Providing affordable and clean energy

Serving electricity distribution customers

With concerns over the affordability of energy and steep rises in the cost of living, SSEN Distribution has learned from the coronavirus pandemic to adapt quickly to support customers who may be struggling with rising energy prices.

Expanding fuel poverty support

In this approach to addressing fuel poverty, SSEN Distribution works with a network of local and national agencies providing specialist direct support to its customers. Engagement with partners, customers and stakeholders has led to a re-focus of some partnerships, broadening the offer to include critical services such as income maximisation and benefit entitlement checks, and ensuring support was available in areas where the price cap offers limited consumer protection, such as homes heated by oil.

Throughout 2021/22, SSEN Distribution supported its customers experiencing fuel poverty, through a variety of partnerships and initiatives, including:

- Enhanced partnership outreach to support hard-to-reach customers: SSEN has well established partnerships with organisations, such as Citizens Advice, Centre for Sustainable Energy and WarmWorx, which undertake targeted outreach to support customers with tackling fuel poverty and promote the PSR. In 2021/22, outreach through these organisations was enhanced with the number of households supported increasing to 6,762 from 3,796 in 2020/21.
- Improving customer referrals: Over 2021/22, SSEN continued to train colleagues to identify signs that customers may require additional support, ensuring we could refer people for specialist, independent advice and support in matters of fuel poverty and energy efficiency. Once referred, customers are called back directly from SSEN’s delivery partners, Home Energy Scotland or YES Energy Solutions.
- A new interactive self-serve tool: SSEN Distribution developed and launched a new interactive online self-serve tool, in collaboration with the Energy Saving Trust, which allows customers to virtually walk around a home and learn where they can make energy savings.

Driving greater Priority Services Register awareness

The Priority Services Register (PSR) is the backbone of support for SSEN Distribution customers who require adapted services, additional support, or extra reassurance during power cuts.

Over 2021/22, SSEN continued to raise awareness of the PSR to ensure it reached those customers in most need. This involved undertaking a PSR gap analysis, both on a geographical and needs code basis, to identify key areas of focus; holding an online workshop with water, emergency response and charities focusing on key PSR gap areas and what channels are best to promote the PSR in different focus areas, and engaging with SSEN’s Inclusive Service Panels who gave important insight into the development of an impactful campaign to identify and seek views which would inform the PSR campaign. The Panels were clear that in the wake of the pandemic we should consider how best to identify those with transient needs, i.e. hospital leavers as this category has emerged more prominently since the pandemic.

There was a considerable increase in customers registered on the PSR between 2019/20 and 2020/21, from 746,821 to 770,844, which was expected as a result of the coronavirus pandemic. This has been followed by a small decrease in 2021/22 to 768,104. The transient nature of vulnerability means that PSR register numbers are never static. People join and leave as they fall in and out of vulnerable situations. SSEN Distribution is watching closely as the impacts of affordability are felt by communities.

An accredited strategy for engagement

SSEN Distribution seeks to ensure that its engagement with stakeholders is effective and supports the achievement of positive and tangible outcomes for customers, stakeholders, and society. SSEN Distribution’s stakeholder engagement strategy continues to meet the AA1000 Stakeholder Engagement Standard (2015), an internationally recognised best practice framework for stakeholder engagement, and its principles of inclusivity, materiality, responsiveness and impact. The successful delivery of the continuous improvement plan has been influenced by AA1000 feedback. In 2021/22, SSEN’s AA1000 ESSE Healthcheck scores rose to 71% from 64% the previous year.

Ensuring a smart and fair future energy system

SSEN’s Smart and Fair project with the Centre for Sustainable Energy has proven to be instrumental in setting standards for future fairness. Phase One of the project made recommendations for policy makers and system operators on how to support the transition to a smart and fair energy system. A key finding from the research was that customers require particular capabilities to be able to access the benefits of smart grids, for example the ability to engage with technology, and access to high-quality broadband, as well as the more conventional things like access to finance.

Phase Two was launched in May 2022 to develop the theories into practical action. Alongside a focus on widening participation, particularly for those who are hard to reach, a tool is being developed to overlay the capability lens research and make it applicable in a local area energy planning context. It takes both publicly available and specialist data, such as credit reference agency analysis, to help understand locations where certain vulnerabilities are more likely to be prevalent in the context of the energy transition. It aims to provide a solid evidence basis for decision makers to understand the implications of decarbonisation projects, such as heat zoning and charge point siting.

Championing equality for EV disabled drivers

In the transition to electrified transport there is the risk that some vehicle users are excluded, and proactive measures are needed to ensure the transition is an inclusive one. In 2021/22, SSEN Distribution launched a two-stage research project in partnership with Disabled Motoring UK to understand the unique barriers and challenges faced by drivers with vulnerabilities adopting EVs and the potential of technologies and DCOs to remove barriers. Over 100 ideas were generated through workshops, with several being selected for in-depth development, such as enabling PSR households to use Vehicle to Home to provide back-up power during a power cut.

The recommendations were published in the Equal EV’ SSEN Distribution report in collaboration with Energy Systems Catapult. The work has supported the inclusion of a commitment to improve accessibility at public charge points for disabled users in the UK Electric Vehicles and Infrastructure Strategy.
Vehicle Infrastructure Strategy. Further collaboration will take place with the industry to implement the solutions identified by stakeholders, such as exploring the implementation of charging services for PSR customers in outages. Industry and government, hosted project webinars and produced video interviews with participants to highlight their experience firsthand.

Developing common standards for domestic flexibility
SSEN Distribution aims to embed fairness in the start of every net zero and low-carbon technology project, to ensure vulnerable customers and communities are not left behind by including their needs from the earliest stages of planning.

Domestic flexibility will be a powerful tool for the future. However, for all consumers to benefit, this must be done responsibly and through a trusted process. Following feedback from both expert and consumer forums, SSEN approached Flex Assure who set common standards for industrial and commercial flexibility services providers (aggregators) to develop a domestic and small business equivalent. The result, HOMEflex, will allow aggregators to earn a HOMEflex trust mark, enabling households and microbusinesses to benefit from flexibility in the knowledge that they will be financially rewarded. Technological advances such as smart charging and smart time of use tariffs have the potential to reduce peak electricity demand by up to 23%, helping avoid or postpone network reinforcement.

Vulnerability Future Energy Scenarios
In 2021/22, SSEN Distribution started conducting Consumer Vulnerability Foresighting with Imperial College London. Currently, investment decisions are guided by Distribution Future Energy Scenarios (DFES) which are based on assumptions using engineering and asset-based predictions and lacks any human, societal or community-based elements.

Outputs from Vulnerability Future Energy Scenarios (VFES) will include plausible societal trends to be considered when planning future networks. These findings were shared with stakeholders at COP26 in Glasgow.

Providing affordable and clean energy
SSE’s customer businesses are its “shop front” offering integrated energy solutions that support customers on their journey to net zero. They provide low-carbon energy supply and new technologies for a decarbonised future.

Low carbon energy solutions for customers

SSE Business Energy
Provides the shopfront and route to market for SSE’s low-carbon energy generation and green products to around 470,000 non-domestic customers across GB.

SSE Airtricity
Ireland’s largest supplier of 100% green energy, supplying around 700,000 homes and businesses across the island of Ireland and first nationally accredited one-stop-shop for home energy upgrades.

SSE Distributed Energy
Provides integrated energy-related services to industrial and commercial customers. With a focus on distributed energy, it has around 11,300 heat network customer accounts.

Increasing value through an adapted approach
SSEN Distribution established a partnership with Centre for Sustainable Energy (CSE) in March 2021 to support fuel-poor households through advice from dedicated Energy Advisors on measures such as supply-switching, access to energy efficiency advice and onward grants including Warm Home Discount. During 2021/22, as the cost of living began to rise, engagement with stakeholders highlighted that SSEN Distribution should seek to support consumers through income maximisation, ensuring that consumers access the financial support they are entitled to.

The CSE Energy Advisor project was reviewed in line with this insight and it was concluded that due to the reduced client financial gain available from switching suppliers, the project was unlikely to achieve its maximum impact. It was decided that the project should be refocused on benefit entitlement checks (BECs) and that income maximisation activity would become a standard offering, with delivery of the project beginning in December 2021.

1,130 households supported with specialist advice
£57,444 client financial gain achieved through benefits entitlement check

“While today’s energy prices are a real concern for customers we must remain equally committed to sustainability for the longer term. It has never been more important for us to work closely with customers to help them become more energy efficient through suitable technologies and behaviours, and to ensure all customers can readily access the greenest energy sources to power their businesses and homes.”

Nikki Flanders
Managing Director,
Energy Customer Solutions

PARTNERING IN ACTION
Providing affordable and clean energy

One-Stop-Shop home energy efficiency solutions

In March 2022, building upon the success of existing partnerships with An Post and several Local Authorities across the country, SSE Airtricity became the first nationally accredited one-stop-shop for home energy upgrades. In line with the Irish Government’s Climate Action Plan objectives in the Republic of Ireland, SSE Airtricity is supporting 800 retrofits for homes across Ireland through these partnerships, supporting almost 800 customers to improve energy efficiency and reduce their carbon output over 1,100 solar installations over 2021/22.

Of the 800 retrofits, 90 were deep retrofits on fuel poor homes. The upgrades are vital and have health and financial benefits for the homeowners. These measures see the average Building Energy Rating (BER) increasing from a D3 to a B2 across these properties. The upgrades are government funded and are free to the homeowner.

800 private and local authority householders supported to retrofit homes and improve energy efficiency

Counteracting cost-of-living increases

In line with the Irish Government’s Climate Action Plan to retrofit 500,000 homes to a BER B2 standard by 2030 and with affordability as a key focus, SSE Airtricity in partnership with Limerick City & County Council and Dun Laoghaire Rathdown County Council completed 117 retrofits on fuel poor homes.

All homes had a full deep retrofit with a complete suite of measures installed such as new windows and doors, external insulation, attic insulation, low energy LED lighting, high efficiency gas boilers installed. SSE Airtricity has also been awarded the contract to install the first communal heat pump system in the Republic of Ireland with 44 units being installed in this project.

These measures delivered a combined energy saving of 1.26 GWh, BER ratings raised from D3 to B2 supporting the decarbonisation of housing stock.

SSE Business Energy

Helping business customers go green

In 2021/22, SSE Business Energy in GB saw an expansion in the number of customers supplied with traceable green products, with the proportion of customers choosing green products growing to 30% from 63 the previous year. Businesses customers recognise the importance of taking action to decarbonise. To help address this, a fixed contract business customers renew with SSE Business Energy, they can be migrated to 100% renewable electricity contracts, matched with independently verified and assured output from SSE’s UK wind farms and hydro plants.

SSE Business Energy also launched a Green EV tariff, which supports businesses running on, or switching to, electric vehicles and enables them to charge fleets with 100% renewable electricity.

6% → 30% Increase in SSE Business Energy customers choosing green products between 2020/21 and 2021/22

In May 2021, a simplified Corporate Power Purchase Agreement (CPPA) approach was established to enable a wider range of customers to purchase energy directly from SSE’s renewable assets, giving customers fully traceable access to 100% renewable energy. This approach aims in the medium term to enable the democratisation of low-carbon energy supply helping an ever increasing number of customers access sustainable energy for their business and associated supply chain.

Under the UK Government’s Smart Programme businesses have also been supported through the installation of approximately 27,000 smart meters, which is crucial in the delivery of flexible products, like time-of-use tariff for EVs, to empower and support businesses toward net zero. 2022 saw 166,000 meters supplied with a green product.

Supporting the ambitions of COP26

Businesses are increasingly looking at ways to reduce their carbon footprint and therefore traceability and transparency of where their energy comes from allows companies to do this in a way they can manage and measure. Energy Customer Solutions green electricity matched to a specific renewable assets supports the demand by business to decarbonise.

In October 2021, SSE Business Energy provided the power for all three COP26 permanent venues in Glasgow. The summit’s power supply came from the Wind Farms in Perthshire operated by SSE Renewables.

The Scottish Event Campus (SEC) moved to 100% renewable energy sources in 2020 as part of its long-term sustainability strategy with SSE Business Energy providing 100% renewable energy to the 14,300 capacity arena for the occasion.

Given the objective of COP 26 in tackling climate change SSE Business Energy supported the ambitions of the event in the carbon reductions at the venues.
Providing affordable and clean energy

SSE Distributed Energy

New horizons for SSE Enterprise

Following the sale of its Contracting and Rail businesses, SSE Enterprise has relaunched its business on distributed energy. Now called SSE Distributed Energy, the business helps people and places reach their net zero targets by adopting a whole-system approach to connect localised and flexible energy assets. It is focused on accelerating growth in battery storage and solar, as well as supporting decarbonisation through EV infrastructure, electrical connections, heat networks and smart places.

Over 2021/22, SSE Distributed Energy has seen key milestones in its developing solar and battery storage businesses, including a secured 380MW solar and battery pipeline and with over 1GW more of other sites currently under assessment. Existing grid connections at legacy coal-fired sites, such as Ferrybridge and Fiddler’s Ferry, puts SSE Distributed Energy in a strong position to deploy battery storage at scale and pace.

Battery Storage assets providing flexible power

Battery storage is crucial when it comes to balancing the electricity grid and paving the way for society to move towards net zero. As a result, SSE Distributed Energy is actively growing its battery storage pipeline. In 2021 SSE purchased the project development rights for its first 50MW battery storage asset on a consented site in Wiltshire. Construction will begin in summer 2022, with full energisation expected in summer 2023.

Once built, this battery will benefit from the remote monitoring and trading services now offered in SSE Distributed Energy through the SSE Enhance platform. The platform will integrate with the site control and monitoring systems and also allow smart trading to maximise the value of these assets.

Expanding solar capabilities

SSE Distributed Energy acquired its first large-scale solar development project in January 2022. Solar technologies are a key complementary technology to SSE’s existing portfolio of low carbon infrastructure such as wind and hydro that support the energy transition.

The 30MW solar farm at Littleton Pastures is located near Evesham in Worcestershire. Once complete in late 2023, the 77-acre site will be capable of powering some 9,400 homes.

Advocating for heat networks

Taking action to decarbonise heat sources is arguably one of the biggest challenges facing UK energy policymakers over the next few decades. Heat networks have the potential to be a cost-effective way of reducing carbon emissions from heating. Over 2021/22, SSE Distributed Energy undertook a range of activity advocating for heat networks. It submitted responses to key consultations including the Scottish Government’s Heat networks delivery plan consultation and three Department for Business, Energy and Industrial Strategy (BEIS) consultations: Heat Networks: Proposals for Heat Network Zoning; A market-based mechanism for low-carbon heat; and, Recovering the costs of heat network regulation.

SSE Distributed Energy also works regularly with its trade associations, The Association for Decentralised Energy (ADE) and Energy UK, and is part of their heat networks working groups. It is also a founding member of the Heat Network Industry Council, a group key stakeholders in the heat networks sector working together to find solutions to decarbonising heat networks.

While climate targets are agreed globally and translated into national plans, the practical actions are implemented locally. Cities, towns and communities will reduce their carbon footprint by turning to electric transport, transitioning away from fossil fuels for heat, and generating more electricity locally. SSE’s distributed energy division has the expertise to support all of those practical actions.”

Neil Kirkby, Managing Director, SSE Enterprise

Decarbonising heat networks to support the path to net zero

In September 2021, SSE Distributed Energy outlined an innovative project in partnership with National Grid, which aims to decarbonise heat networks, capturing waste heat from electricity transformers to generate hot water and space heating for homes and businesses. The technology offers a route to net zero heat when applied to transformers served by 100% renewable electricity from wind or solar farms. It is estimated that the heat recovery project will initially reduce heat network carbon emissions by more than 40% versus traditional gas-fired systems.

The heat recovery project can potentially save millions of tonnes of CO2 every year if rolled out across National Grid’s network of transformers across England and Wales, harnessing this waste heat via SSE Distributed Energy’s heat networks to serve towns and cities across the region. Due to the location of the electricity transformers, they have the potential to become valuable community assets turning transformers into community ‘boilers’ that serve local heat networks with a low or even zero-carbon alternative to fossil-fuel powered heat sources such as gas boilers.

SSE Distributed Energy’s heat recovery technology is currently undergoing a proof-of-concept trial at National Grid’s Deeside Centre for Innovation, the first facility in Europe where assets associated with electricity networks can be tested off-grid. The centre is designed as a unique environment for developments and trials of new technologies and practices. Deeside is a key part of National Grid Electricity Transmission’s Innovation programme, a series of projects, informed and developed by stakeholders, innovating to address the challenges of the energy transition.

The road to renewables

In October 2021 SSE’s COP26 electric bus spent 11 days showcasing net zero projects over 1,000 green miles on its ‘road to renewables’ concluding in Glasgow. As part of the engagement undertaken with stakeholders on this journey the bus visited the Scottish Parliament to give MSPs their chance to learn about the benefits, both environmental and economic, in the transition towards net zero.

The bus made a stop at First Caledonia bus depot, where SSE is helping install charging infrastructure to power 150 clean green buses for Glasgow at what will be the biggest depot in the UK, once finished, and provide cleaner air for the city.

The First Bus EV charging facility will support the transport transition and a more sustainable means of transport.

Investing in industry, innovation and infrastructure

Significant investment is needed in electricity infrastructure and new technologies to deliver an accelerated transition to net zero.

It is understood that the electricity sector will be the first to decarbonise in order to support the decarbonisation of other sectors and allow the transition to net zero at pace. SSE seeks to accelerate this decarbonisation and has an ambitious investment plan out to 2026 focused on low-carbon electricity assets and infrastructure. The scale of the transition to net zero will require continuous innovation and new technologies to be developed. SSE’s approach includes carefully chosen partnerships to develop the technologies, experience and skills that it needs to accelerate projects in support of net zero.

Enable low-carbon generation and demand

Enable at least 20GW of renewable generation and facilitate around 2 million EVs and 1 million heat pumps on SSEN’s electricity networks by 2030.

SSEN Transmission increased the renewable capacity connected to its network by around 1GW. SSEN Distribution progressed key innovation projects to support flexible markets and future infrastructure provision for low-carbon technologies.

SSEN Transmission made strong start of the first year of its five-year RIIO-T2 price control period and continued to deliver against its strategic objective to enable the connection of renewable capacity to its network. In 2021/22, there was 7.8GW of renewable capacity connected to SSEN Transmission’s network, up from 6.8GW the previous year.

In 2021/22, SSEN Distribution had 12 ongoing strategic partnerships and initiatives exploring smart grid solutions to support low-carbon technologies, including being one of the founding partners of a new global smart grid partnership. It had around 58,000 electric vehicles registered in its licence areas and around 46,000 heat pumps connected to its networks.

Our progress

SSEN Distribution has 12 strategic partnerships and initiatives exploring smart grid solutions to support low-carbon technologies.

1 Figures are for calendar year 2021. As SSE’s 2030 Goal was updated in 2022 to include ambitions around the facilitation of EVs and heat pumps on SSEN Distribution’s network, this is the first year the information is being disclosed in SSE’s Sustainability Report.
2 Calculated using the number of smart meters connected to SSEN Distribution’s network which are communicable by SSEN as a proportion of SSEN Distribution’s reported customer numbers.
3 Over 2020/21, SSE undertook a strategic review of its work on investment in research and innovation. 2019/20 data was not collated but instead a baseline of 2020/21 data was created against which to benchmark future years’ investment.

Creating value in the transition to net zero

Achieving net zero will mean fundamental changes right across the economy and society, which create opportunities for increased efficiency and economic prosperity.

Investing in a net zero future

SSE’s approach is to invest in a well-balanced mix of assets and businesses that support the net zero transition. The completion of the sale of SSE’s remaining stake in gas distribution operator SGN represented progress towards sharpening the Group’s focus on net zero.

In November, SSE published its £12.5bn Net Zero Acceleration Programme to 2026 aimed at accelerating clean growth, alongside ambitious 2033 targets, aligned with net zero and 1.5°C. It is estimated that SSE’s capital investment could total in excess of £25bn this decade in the UK and Ireland. This significant investment will contribute towards tackling climate change whilst securing indigenous energy supplies and creating high quality low-carbon jobs. It will also enable delivery of around 20% of the UK’s revised 50GW offshore wind target and over 20% of UK electricity networks investment, whilst deploying flexibilities, solutions and exporting renewables capabilities overseas.

A central role for innovation

The transition to net zero will require transformation across the energy system, and SSE’s focus is on enabling, harnessed and deploying new technologies and innovations which can accelerate this journey. SSE has a well-established approach to innovation, which enables its businesses to partner with others to develop the technologies, experience and skills that it needs to accelerate projects in support of net zero.

SSE’s approach to innovation and technology

SSE is focused on enabling, harnessing and deploying new technologies and innovations which can accelerate the journey to net zero.

Empowering innovation in SSE’s business units

Each SSE business sets their own innovation priorities, whilst Group services co-ordinate cross-cutting innovation and growth areas. An open innovation ecosystem supports the SSE businesses to achieve their innovation priorities which is harnessed through four enabling pillars (Partnering for Innovation; Learning by Doing, Digitalisation and; and Talent) which provide the businesses with access to technologies, experience and skills.

A culture of innovation is promoted through a dedicated innovation team within SSE and two Engineering Centres of Excellence. The Networks Innovation team provide expertise to leverage regulatory funding for innovation and their focus is on accelerating a low-carbon transition and co-creating with partners to develop whole-system solutions. The Engineering Technology Centre of Excellence with SSE Renewables and Thermal enable technology and digital solutions for cost-effective renewables and innovation in pumped hydro, CCS and hydrogen.
Industry, innovation and infrastructure

PARTNERING FOR INNOVATION

SSE seeks to proactively engage with external partners including its peers, local authorities, supply chain, academia and wider industry and has built significant expertise and capability in forming effective consortia. Co-creation with energy industry peers is crucial to facilitate whole system solutions and SSE is a member of a number of ongoing Collaborative Innovation Partnerships. SSE has an enduring commitment to the University of Strathclyde of more than seven years and has been a member of the Imperial Business Partners programme for over two years.

Value created
• Proactive engagement with stakeholders
• Develop whole-system solutions

Decarbonising heat networks – page 45
SSE Distributed Energy is partnering with National Grid to capture waste heat from electricity transformers to generate hot water and space heating for homes and businesses.

Trialling SF₆ alternatives – page 96
SSEN Transmission is working with suppliers to use new, more environmentally friendly gas insulated equipment by installing SF₆ alternatives across its network.

LEARNING BY DOING

SSE’s aim is to accelerate technologies to higher readiness levels for deployment, learn from other utilities and industries and mitigate the risks of implementation of new technologies. SSE is a founding member of two National Demonstration Research Centres and leading industry projects such as Project LEO and Electricity Transmission Collaboration Panel, through which the businesses are able to manage trials to test and scale new solutions.

Value created
• Accelerate technologies to higher readiness levels in Demonstration Centres
• Mitigate risk of disruption

Innovation in action
Zero carbon clusters – page 64
SSE Thermal is partnering with more than 25 leading industrials to develop plans for hydrogen and CCS as part of zero carbon industrial clusters.

Demonstrating smart grids – page 63
SSEN Distribution is a founding member of a new global smart grid partnership that will facilitate the sharing of learnings from innovation projects and support a collaborative transition to a decarbonised future.

TALENT

SSE promotes a culture empowering employees to drive innovation and develop the ability to make decisions in uncertainty. This is done through programmes such as Generation Innovation, Enterprise Ideas, the Career Development Programme, and a knowledge transfer partnership with the University of Strathclyde. SSE’s talent strategy focuses on inclusivity, fairness and flexibility to actively engage a diverse range of talent in the market, as well as developing future leader learning for all and the capability to respond to the future needs of the business.

Value created
• Engage employees within a culture of innovation
• Align talent recruitment with future capability requirements

Innovation in action
Encouraging employee innovation – page 78
SSE Distributed Energy has created a new innovation platform for employees to deliver solutions to key operational challenges.

Investing in future capability – page 78
Developing a Unique Procurement and Commercial Leadership Development Programme to deliver new skills for the energy transition to zero carbon.

DIGITALISATION

Investment in and adoption of digital is fundamental to achieving successful development, efficient operation and responsible ownership of energy infrastructure. SSE invests in and adopts a range of digital solutions, including drones, AI and Digital twins. SSE continues to strengthen and evolve its approach to cyber risks with control frameworks to identify threats and reduce exposures. SSE also supports using open data to manage the network better and improve the customer experience.

Value created
• Capability to develop and leverage new digital platforms and technology
• Detect, protect and responding to evolving cyber risks

Innovation in action
Using AI to balance the grid – page 42
SSE Airtricity has partnered with Cool Planet to help alleviate pressure on Ireland’s electricity system and intelligently balance the national grid.

Partnering on digital solutions – page 57
SSE Renewables has launched a digital ventures team and partnered with Avarade and Microsoft to deliver solutions to net zero at speed.
Committed to decent work and economic growth

Driving sustainability in the supply chain

As described in detail on page 59 of SSE’s Annual Report 2022, an overhaul of SSE’s sustainable procurement strategy began in 2020 and continued to be a priority for the business over 2021/22. With plans to invest £25bn in low-carbon infrastructure over the next decade, SSE recognises there are numerous risks from the mismanagement of sustainability issues, as well as enormous opportunities from a focus on the socio-economic and environmental value created through its supply chain activities. SSE is in the process of transitioning to a more sustainable procurement model where sustainability risks are fully managed alongside opportunities to collaborate and drive innovation. The key actions setting out how SSE is delivering this change are shown in the graphic below.

One particular area in which SSE made significant progress in 2021/22 was the roll-out of a new supply chain reporting tool across all of SSEN Transmission’s active large capital projects. The Sustainability Data Capture Tool (SDCT), which is specifically designed to manage and visualise supply chain sustainability performance at a project level, is used to measure sustainability progress and to meet regulatory reporting requirements. SSEN Transmission aims to use this data to develop baselines, set targets, and implement data-based decision making to drive further sustainability and meet business goals.

Ronnie Fleming
Chief Procurement Officer

Measuring social value in the supply chain

In 2020/21, recognising that the energy sector is in transition with a need for new skills, SSE’s Procurement and Commercial (P&C) department developed a Leadership Development Programme a key part of which required the cohort of P&C professionals to deliver a project that would add value to SSE Group. The project selected by the cohort focused on creating and measuring social value within SSE’s supply chain.

The project involved working closely with SSE’s supply chain partners on its major projects to enhance the jobs and skills impact of investment. This included: creating partnerships at community level, engaging SSE’s supply chain to support its Sustainable Procurement Code; increasing skillsets within the industry through training opportunities; providing local employment opportunities; and attracting talent who want to work for companies that incorporate social value.

Over 2021/22, SSE began piloting its approach across five projects over a period of six months and due to finish in 2022/23. The pilot has included embedding social value into tender requirements, engaging with suppliers on employability, apprenticeships, and graduate programmes, and asking suppliers to provide commitments on social value and reporting on delivery. SSE are working with sustainability experts Action Sustainability to produce a roadmap with recommendations for the full-scale roll-out of the approach which will embed learnings from the pilot.

ENGAGEMENT IN ACTION

Embedding sustainability in Large Capital Projects

In early 2021/22, Deloitte undertook a review of SSE’s Large Capital Project (LCP) governance framework and made a recommendation that sustainability should be embedded throughout the process to align with the company’s business goals and material UN Sustainable Development Goals (SDGs). SSE recognised that to meet its 2030 goals, and deliver against the UN SDGs, its Large Capital Projects should be designed and constructed to enable the journey to net zero, deliver socio-economic benefits and facilitate a just transition. The company consequently undertook a refresh of the sustainability requirements in its LCP governance framework to meet four key objectives:

1. Ensure SSE is delivering LCPs in a sustainable way;
2. Encourage and increase sustainability throughout the LCP value chain;
3. Increase awareness of and reduce sustainability risks that could cause issues for the project, wider society, or the environment; and
4. Increase innovation and maximise the opportunity to deliver a positive impact on wider society and the environment, going above and beyond regulations.

The newly updated LCP governance framework requires LCP project teams to embed sustainability throughout the project process, ensuring sustainability risks are mitigated and sustainability opportunities are maximised across all sustainability criteria aligned to the UN’s SDGs. This covers key topics from whole life carbon, climate adaptation, circular economy, biodiversity to modern slavery and human rights, and maximising local content.

From 1 April 2022, a Sustainability Assessment and Action Plan (GAAP) is required for all and in development projects. Guidance, training, and additional resources for project teams support the roll-out of this new approach, in addition to partnering with external experts at the Supply Chain Sustainability School.
The Powering Net Zero Pact (“the Pact”) is a new initiative created by SSE with 10 other founding partners as a legacy of COP26. The Pact brings together companies across all tiers of the power sector globally – including civils, shipping, renewables, electrical engineering, and others – to achieve a fair and just energy transition to net zero. Over a six-month period, the 11 founding partner companies of the Pact – which, alongside SSE, includes: Balfour Beatty; DEME Group; GE Renewables; Hitachi Energy; NKT; RJ McLeod; Siemens Energy; Siemens Gamesa; Subsea 7; and Vestas – met on a regular basis to agree areas of focus, shared commitments, and topics for future collaboration.

The Pact focuses on five areas of ambition: achieving net zero carbon emissions; protecting and enhancing the natural environment; transitioning to a circular economy; guaranteeing fair work and sustainable jobs; and adding value to local communities. Each area of ambition has a shared commitment and area for collaboration, as detailed in the table on the next page.

Any organisation that wants to be involved in driving forward a just energy transition to net zero can become a Powering Net Zero Pact signatory and part of a network of leading global companies committed to working together to deliver real change.

To sign up to the Pact, companies must:
• Be involved in some part of the power sector;
• Meet all five of the shared commitments; and
• Be willing to participate in an action-focused working group for at least one of the five collaboration topics.

More information can be found at sse.com/sustainability/poweringnetzeropact or by emailing poweringnetzeropact@sse.com

Ambitious renewables growth to support net zero

SSE Renewables’ considerable expertise in the development, construction, and operation of renewable electricity, alongside an envisaged pipeline of high-quality projects, means it is at the forefront of providing the clean energy needed for the net zero transition.

Supporting the delivery of accelerated renewables ambition

The British Energy Security Strategy, published in April 2022 set out enhanced ambitions to drive the delivery of net zero, increasing a target for offshore capacity from 4GW to 5GW by 2030. SSE’s Net Zero Acceleration Programme out to March 2026, seeks to deliver a doubling of installed renewable capacity to 8GW. SSE Renewables also has further ambitions to increase this to over 13GW by 2031. These plans will enable delivery of around 20% of the UK’s enhanced offshore wind capacity target and are crucial in supporting SSE’s refreshed 2030 Goal of increasing renewable generation output fivefold between 2017/18 and 2030, to 50TWh a year.

SSE has ambitious plans for increasing installed renewable generation capacity:

<table>

Progressing flagship wind projects

SSE Renewables made good progress on key offshore projects in 2021/22, including reaching financial close on Dogger Bank C and progressing construction at Dogger Bank A and B (each 1.2GW). SSE Renewables also progressed at the 1GW, 600MW Dogger Bank East project (SSE Renewables share 49%) and first power is currently expected in July 2024. When complete, Viking wind farm is expected to be amongst the highest-yielding onshore wind farms in Europe. In addition, progress at Lenlea wind farm (30MW, SSE Renewables share 36%) in Ireland will see it be commissioned in late 2020 early 2023.

At 31 March 2022, SSE had 2.4GW of renewable energy capacity in construction (based on equity share).

Developing a strong domestic pipeline

SSE Renewables is currently building more offshore wind than anyone else in the world and, over 2021/22, it continued to expand its sector-leading pipeline with opportunities for renewable development across the UK and Ireland.

In January 2022, SSE Renewables added its first floating offshore wind project to its domestic pipeline with the success in Crown Estate Scotland’s ScotWind offshore wind seabed leasing process as part of a consortium with Marubeni Infrastructure and MIP (Copenhagen Infrastructure Partners). The up to 2.6GW site (SSE Renewables share 40%) in the Firth of Forth will be one of the largest floating wind projects in the world and aims to start generating by 2030.

In Ireland, SSE Renewables will now progress Arklow Bank Wind Park V via the new Marine Area Planning regime. The revised project will proceed with an increased capacity of 800MW and, subject to securing the necessary consents and route to market, could be complete by 2031. A foreshore licence application has also been submitted for the 700MW site that will show in real-time what is going on below the surface of the water, enabling cause and effect to be modelled in a very transparent way. A requirement of the Dutch Government is that this data must also be open source, meaning that unprecedented amounts of data will be shared and it could be the world’s largest digital research project of its kind.

“With wind power the most cost-efficient source of generation, SSE Renewables’ portfolio of wind assets and its considerable pipeline of projects will support a more affordable transition net zero for energy consumers in the UK and Ireland. We also have our sights set internationally, expanding ambitions into new carefully selected markets overseas.”

Stephen Wheeler, Managing Director, SSE Renewables

In July 2021, SSE Renewables announced the creation of a 50/50 joint venture with ACCIONA Energía to develop offshore wind opportunities in the Polish energy market, with an application having been made by SSE Renewables for offshore development rights in the Baltic Sea, which would be codeveloped with ACCIONA Energía.

In addition, in September 2021, SSE Renewables signed an agreement to create a joint ownership company with Pacifico Energy, one of Japan’s largest developers of renewable energy, that will pursue the development of offshore wind projects in Japan. The creation of SSE Pacifico also involved the acquisition of an 80% interest in 10GW of early-stage development opportunities across Japan.

Most recently, in April 2022, it entered into an agreement to acquire Siemens Gamesa Renewable Energy’s (SGRE) Southern Europe wind, solar and batteries development platform. The SGRE portfolio includes c.3.9GW of onshore wind development projects across Spain, France, Italy and Greece, with scope for up to 1.5GW of additional co-located solar development opportunities.

In the Netherlands, SSE Renewables has submitted bids in the 1.4GW Hollandse Kust (west) offshore wind tender for two separate sites of 700MW each. It has formed a 50/50 strategic partnership with Brookfield for the bids.

Digital solutions to support the delivery of net zero

SSE Renewables has teamed up with technology leader Microsoft and Avarade on a series of digital innovation projects which are developing solutions to improve understanding of the impacts wind farms have on surrounding ecosystems. Through the partnership, the companies are implementing two ground-breaking digital innovation projects:

• Species monitoring using artificial intelligence (AI): In May 2020, SSE Renewables installed four cameras on the Isle of May to pilot the use of AI to accurately monitor local puffin colonies as part of planning conditions for its Beatrice offshore wind farm. The AI technology gathers footage and automatically detects and counts the birds during their breeding season, and has learned not to count the same puffin twice in the field of view. This initial trial was finalised over 2021/22 and the AI technology has proven a success. Live deployment at Dunbeath, in Caithness, is expected to place in September 2022.

• ‘Digital twin’ site: In April 2022, SSE Renewables submitted a bid to tender for the Hollandse Kust (West) project. The bid proposes using LiDAR, Sonar, hydrophones and AI amongst other technologies, to create an ecological ‘digital twin’ of the site that will show in real-time what is going on below the surface of the water, enabling cause and effect to be modelled in a very transparent way. A requirement of the Dutch Government is that this data must also be open source, meaning that unprecedented amounts of data will be shared and it could be the world’s largest digital research project of its kind.

SSE Renewables believes these projects will enable learning on how to limit and avoid negative impacts of wind farm developments while promoting the positive ones, and facilitate research and collaboration.
SSE Renewables UK and Irish pipeline and international growth opportunities*

In July 2021, SSE created a 50/50 joint venture with ACCIONA Energía to develop offshore wind opportunities in the Polish energy market, with an application having been made for offshore development rights in the Baltic Sea.

SSE Renewables is also assessing other growth options across selected markets in Northern Europe and the United States. Towards the end of 2021/22, it opened an office in Boston and is assessing participation in upcoming offshore leasing rounds, for example, in California, which is expected to take place in Autumn 2022.

*Figures based on equity share at April 2022. For more information see pages 38 to 41 of SSE’s Preliminary Results for the year to 31 March 2022, available at sse.com/investors.
Industry, innovation and infrastructure

Building a network for net zero

Significant growth in SSEN’s transmission network over the next decade will facilitate the connection of increasing renewable capacity in the north of Scotland, which will play a crucial role in supporting the UK’s climate ambitions.

Delivering a network for net zero

2021/22 marked the first year of SSEN Transmission delivery against its business plan for the new five-year RIIO-T2 price control period, running from 2021 to 2026. Significant progress was made building out critical network infrastructure to unlock renewable generation in the north of Scotland. This included progress on the Shetland HVDC transmission link, which will see Shetland connected to the GB transmission system for the first time, enabling the connection of renewables and supporting Shetland’s security of supply. The project is on track for completion and energisation in 2024. In addition, in January 2022, Tealing substation was completed, which will enable the connection of the Seagreen offshore wind farm.

Growing a network to meet the scale of change needed for net zero will require ambitious investment programmes over and above thebaseline settlement agreed with Ofgem, the regulator, for nearly £2.8bn of approved ‘Certain View’ investment. During 2021/22, progress has been made on a number of plans for investments by SSEN Transmission over and above the Certain View. These additional investments, which are being taken forward through Ofgem’s Uncertainty Mechanisms, will be key to delivering a pathway for net zero.

Progress has included:

- Approval of Final Needs Case (FNC) for the 2GW Peterhead to Drax link; Ofgem approved the FNC in March 2022 for the initial work on the first of two planned HVDC links connecting Peterhead power station to demand centres in England.
- Initial Needs Case (INC) submitted for the Argyll and Kintyre 275kV Strategy: SSEN Transmission submitted the INC to Ofgem in March 2022 for work needed to upgrade the main Argyll transmission network from 132kV, supporting the forecast growth in renewables in the region.
- Response to INC for the Fort Augustus to Skye transmission line: in April 2022, Ofgem published its response to SSEN Transmission’s INC for the replacement and upgrade of the Fort Augustus to Skye transmission line, required to maintain security of supply and to enable the connection of renewable electricity generation along its route. This paves the way to progress to the FNC stage of the regulatory approval process.

Facilitating the connection of renewables

The RIIO-T2 period is expected to deliver significant growth in the capacity of renewables connected to SSEN Transmission’s network, from around 6.8GW in 2020/21 to around 14GW by March 2026. The total installed renewable capacity connected to the network increased by 1GW, to 7.8GW in total. SSEN Transmission is well on its way to delivering its RIIO-T2 goal to transport the renewable electricity that powers 10 million homes, which will be met once the installed capacity of renewables reaches 15GW. This growth will play an important role in achieving SSE’s medium-term 2030 Goal to enable low-carbon generation and demand, which is targeting at least 20GW of renewable generation capacity connected to SSEN’s transmission network by 2030.

By 2026, SSEN Transmission is targeting to transport the renewable electricity that powers 10 million homes and to unlock renewable generation in the north of Scotland.

Innovation in action

In November 2021, SSEN Transmission submitted a number of proposals to Ofgem as part of the Strategic Innovation Fund (SIF) programme, a scheme to help stimulate innovation that can help transform the UK’s energy systems in line with net zero targets in the coming years. In March 2022, three of these SSEN Transmission-led projects were successful in moving to the first round of funding, known as the ‘Discovery’ stage, and were each awarded £500,000.

The three projects include technology aimed at developing new innovative methods to build resilience and improve network reliability, and will provide critical learnings to help inform the future development of the energy system.

Network DC: is looking at enabling installation of the offshore wind capacity required for net zero by demonstrating the capability of Direct Current Circuit Breakers (DCCBs) in supporting the development of HVDC grids. The development of offshore direct current networks cannot exist without DCCBs, which are needed to minimise the impact of faults, allowing power to keep flowing elsewhere on the network.

Project NIMBUS: is exploring the capability to use high-resolution weather and climate data to help accurately predict the impact of climate change on transmission assets over their lifetime. This will lead to improved intervention planning and asset protection, which could extend asset lifespans by 50 to 20 years.

Project Incentive: is investigating new solutions to address the issue of increased intermittent offshore wind capacity connecting to the grid. It will demonstrate the use of innovative voltage, current and frequency control technologies coupled with energy storage at the point of onshore connection of offshore wind farms, to allow offshore wind farms to stabilise the onshore grid and reduce the risk of blackouts.

A two-month ‘discovery’ phase on the proposals for each project is currently underway, after which the projects can apply for the second phase of development, with the potential to be awarded up to £500,000 to take the projects forward to further phases.
Industry, innovation and infrastructure

Powering communities to net zero

As local electricity networks undergo a transformation in the coming years, SSEN Distribution is building a strong foundation to meet the electricity demands of the future and make net zero a reality for customers and communities.

A stakeholder-led business plan for net zero

Local electricity networks will be a key enabler in the transition to net zero, as the electrification of heat and transport gathers pace alongside new smart flexible-energy solutions. In December 2021, SSEN Distribution submitted its final RIIO-ED2 business plan for 2023 to 2028 to the energy regulator, Ofgem. The stakeholder-led plan aims to balance the need to accelerate investment in the smart and flexible electricity networks that will meet new decarbonisation demands, while keeping costs down for consumers and supporting those who are most vulnerable. It sets out a total expenditure of around £4bn to deliver improvements for customers and accelerate investment in its networks to power communities to net zero.

SSEN Distribution’s plan has six key goals focused on resilience, customers, and working towards net zero – one of which is to facilitate the connection of an additional 1.3 million electric vehicles (EVs) and 800,000 heat pumps in its licence areas by 2028. This supports SSE’s refreshed 2030 Goal to enable low-carbon technologies.

In 2021/22, SSEN Distribution had 12 ongoing strategic partnerships and initiatives exploring smart grid solutions to support low-carbon technologies. These included:

- **Project CEO:** taking place in Oxfordshire, it is one of the UK’s most ambitious, wide-ranging and innovative energy trials, seeking to accelerate the UK’s transition to a zero-carbon electricity system. You can read more at project-ceo.co.uk.
- **Optimise Prime project:** the world’s largest trial of commercial EVs which seeks to investigate the effects of commercial fleets on the electricity distribution network. Physical trials for the project began in August 2021. More information available at optimise-prime.com.
- **The Skyline project:** is establishing data sharing with the automotive and charge point industries, allowing Distribution Network Operators (DNOs) to prepare when and where new electricity demand to charge electric vehicles is coming from, to inform infrastructure requirements and improve customer experience.
- **Project Re-Heat:** the first DNO-led large scale heat trial and will see 150 heat pumps installed in domestic homes across three local authority areas. These heat pumps will be connected to thermal storage units, enabling customers to be more flexible in the times they use electricity for heating.

“Local electricity networks are at the forefront of the transition to net zero, and the behavioural shift that will be needed by consumers as we move to smarter electricity networks will be unprecedented. Our focus is on trialling new methods and new technologies that will facilitate this transition in a way that provides the best value and is inclusive for all energy consumers.”

Chris Burchell
Managing Director, SSEN Distribution

Tackling GHG emissions from SSEN’s electricity distribution network

As its network develops to support the net zero transition, SSEN Distribution must ensure that it takes steps to reduce its own carbon footprint and the impact it has on the environment. In October 2021, SSEN Distribution became the first UK Distribution Network Operator to set science-based targets in line with a 1.5°C pathway, verified by the SBTi, which play an important role in supporting SSE Group’s net zero ambitions.

SSEN Distribution’s SBTi-approved targets are to:

- Reduce its combined scope 1 and 2 GHG emissions by 55% by 2033 from a 2020 baseline.
- Work closely with its supply chain so that 35% of its suppliers have a science-based target set by 2026.

In reducing its scope 1 and 2 GHG emissions, SSEN Distribution is targeting GHG emissions reductions from electricity losses and diesel generation. SSEN Distribution’s RIIO-ED2 business plan sets out an updated losses strategy, focusing on understanding and managing technical losses across the network, as well as an enhanced SF6 leakage reduction strategy. For more information on the work SSEN Distribution is doing to address GHG emissions arising from losses and SF6, see pages 32 and 96 respectively.

The plan also outlines SSEN Distribution’s commitment to produce a diesel strategy to transition away from carbon-intensive fuels on the Scottish Islands, where diesel backup plants are used to ensure continuity of supply. It will explore a number of options, including: looking into an alternative fuel type for its backup generation; progressing its involvement in a proposed new mechanism for an alternative solution to the Scottish Island diesel backup plants, called Hebrides and Orkney Whole System Uncertainty Mechanism (HCWSUM); and, working with engaging with its supply chain to understand what alternative flexible solutions are currently available.
Industry, innovation and infrastructure

A changing role for thermal generation in a net zero world

With thermal generation continuing to be relied upon to meet electricity system demand, SSE Thermal is actively developing low-carbon generation options to ensure continued security of supply and to provide the generation flexibility that society needs on the transition to net zero.

Delivering efficient CCGT plant for the near term

SSE Thermal is committed to the responsible phased reduction of unabated gas output at the same time as repurposing key assets for the net zero world. It is well understood that unabated thermal generation has a diminishing but essential part to play as the UK and Ireland transition to net zero, and recent market volatility has reinforced the importance of its role in ensuring a resilient energy transition.

In 2021/22, the final phase of development at SSE Thermal’s 893MW Keadby 2 progressed well. Commissioning started in October 2021 and a capacity market agreement will be in place from October 2022, therefore the power station is expected to be fully commercially available ahead of this date. Keadby 2 brings Siemens’ cutting-edge turbine technology to the UK, this first-of-a-kind turbine will be Europe’s most efficient CCGT and will displace older, more carbon intensive plant on the system. It is capable of being upgraded to decarbonise the system further, through hydrogen blending or carbon capture and storage. The completion of Keadby 2 will come at a crucial time to support the UK to secure indigenous energy supplies and provide continued flexibility for the electricity system as the country transitions to net zero.

Developing a thermal generation fleet for net zero

To deliver GHG reductions in line with a 1.5C pathway, considerable reduction in the emissions from SSE Thermal’s generation plant will be required. To achieve this, SSE Thermal’s strategy is focused on both decreasing the output from, and therefore investment in, existing unabated generation whilst at the same time increasing investment to build a significant portfolio of carbon capture and storage (CCS) and hydrogen power stations and repurposing the assets for the net zero world.

SSE Thermal is developing CCS projects with Equinor at Keadby and Peterhead, as well as two further projects in the Humber. Keadby Hydrogen power station and a hydrogen storage facility at Aldrington. These projects will play a pivotal role in helping to achieve national net zero targets, and SSE Thermal has made substantial progress over 2021/22. In January 2022, both Keadby and Peterhead Carbon Capture and Storage projects were submitted into Phase 2 of the UK Government’s Cluster Sequencing Process, with outcomes expected to be announced in mid-2022. These projects combined could see up to 3 million tonnes of CO2 captured a year.

In October 2021 the UK Government announced that the East Coast Cluster – comprising the Humber and Teesside regions – would be Track 1 clusters, or the first clusters supported to deploy shared CCS infrastructure by the middle of this decade. The Scottish cluster was identified as a reserve Track 1 cluster and remains in line to progress to deployment as a Track 2 cluster by the end of the decade.

SSE Thermal also made progress on the development of its low-carbon hydrogen projects, alongside Equinor. For more detail on progress see the case study on the next page.

‘Over the past year SSE’s Thermal generation assets have provided much needed flexibility to support a volatile energy market with increasing penetration of intermittent renewables, demonstrating the valuable role they have in delivering a resilient and orderly transition to net zero. Our focus remains on developing and progressing new low-carbon thermal generation options.’

Catherine Raw
Managing Director, SSE Thermal

Exploring low-carbon hydrogen options

The UK Government’s inaugural hydrogen strategy, published in August 2021, highlighted the important role it will play in providing flexible energy for power, heat and transport and the need for large hydrogen storage facilities.

In 2021/22, SSE announced the development of low-carbon hydrogen projects in the Humber, in partnership with Equinor:

- Keadby Hydrogen Power Station: the power station would have a peak demand of 1,800MW of hydrogen, producing zero emissions at the point of combustion. It would be the world’s first major 100% hydrogen-fired power station, securing at-scale demand for hydrogen in the region for decades to come. With appropriate policy mechanisms in place, Keadby Hydrogen could come online before the end of the decade.

- Aldrington Hydrogen Storage: with an initial expected capacity of at least 320GWh, it would be significantly larger than any hydrogen storage facility in operation in the world today. Hydrogen storage is expected to play an important role in a low-carbon hydrogen economy, balancing supply and demand with hydrogen produced using carbon capture and electrolytic technologies.

SSE Thermal is also involved in an initiative to promote the Isle of Grain as a location for a low-carbon hydrogen economy. This could provide the opportunity to bring low-carbon hydrogen to SSE’s Medway site.

SSE Thermal sees significant further growth opportunities in this space, in line with the UK’s target to deliver 10GW of low-carbon hydrogen production by 2030.
Committed to decent work and economic growth

Considered planning for the social consequences of net zero provides an opportunity to create good quality jobs and share economic value widely.

Change of the scale and nature needed to achieve net zero brings social consequences, impacting people – employees, consumers, communities, suppliers, and wider society – in many different ways. SSE has a responsibility to influence those impacts positively, which is why its alignment to SDG 8: Decent Work and Economic Growth is a core strand of its strategic approach. In aligning to SDG 8, SSE has committed to being a global leader for a just energy transition to net zero, with detail on how it is meeting that goal detailed on the following pages.

Champion a fair and just energy transition
Be a global leader for the just transition to net zero, with a guarantee of fair work and commitment to paying fair tax and sharing economic value.

SSE was ranked the top company globally in the World Benchmarking Alliance’s just transition assessment in November 2021.

Over 2021/22, SSE continued to engage widely on its Just Transition Strategy and published a second just transition report focused on action to support the worker transition to net zero. Underpinning its just transition approach, SSE maintained its Fair Tax Mark and real Living Wage accreditations, and completed its first year with the Living Hours accreditation. SSE contributed £4 of value to the UK and Irish economies for every £1 earned in adjusted operating profit, and granted over £11m to communities and charities across the UK and Ireland. It also led efforts to bring collaboration across its sector through the creation of the Powering Net Zero Pact.

Our progress
8 Consecutive years of Fair Tax Mark accreditation
1st year of being Living Hours accredited
9 Consecutive years of being Living Wage accredited
Commitment to economic and work growth

A fair and just transition

Embedding the just transition in SSE’s strategy

The case for climate action is indisputable. However, the way economies decarbonise is less definite. Without careful planning and deliberate consideration of the implications of the transition on people – whether that’s workers, consumers or communities – the social legitimacy of net zero itself. A ‘just transition’ is therefore the fairest way of ensuring that the benefits of climate action are shared widely, whilst preventing an unfair burden of the costs on those with least ability to afford it.

In November 2020, SSE became the first company in the world to publish a Just Transition Strategy. This strategy outlines 20 principles to promote a fair and just transition for workers, consumers and communities when transitioning to a net zero world, while at the same time transitioning ‘out’ of high-carbon activities. The importance of the just transition to SSE is reflected in its update to one of its four company 2030 Goals, with the explicit aim to ‘ Champion a fair and just energy transition’. The actions underpinning a just transition which are outlined within this 2030 Goal – guaranteeing fair work, fair tax and sharing economic value – form the structure of this section of SSE’s Sustainability Report 2022.

For more information on SSE’s just transition approach, go to sse.com/sustainability/just-transition and careers.sse.com/just-transition.

SSE’s progress on the just transition over 2021/22

Communication and consultation on SSE’s Just Transition Strategy

Throughout 2021/22, SSE met with a wide range of stakeholders to gather feedback and develop its just transition approach. This included meetings with policy makers, trade union partners, suppliers, oil and gas companies, investors, academics, and industry and skills bodies. Most importantly, SSE undertook primary research with its own employees that have transitioned from high to low carbon careers, including: a detailed survey of over 150 people; gathering information on engagement through its employee survey; and focus groups. In addition, SSE contributed to more than 30 stakeholder events over the year focused on just transition.

From principles to action

Using the findings from its research, engagement and consultation over the year, SSE published a new report From Principles to Action. Supporting workers transition from high to low-carbon careers in September 2021. This report outlines 20 commitments for SSE, 10 recommendations for industry and 10 recommendations for governments which are all focused on practical actions to support workers transition.

At an industry and government level, these include things like developing ‘all energy’ frameworks for skills, fair work terms where there is public sector support for climate action, and making sure net zero sector plans embed the concept of a just transition. And for SSE, clear commitments include not asking for industry-specific experience unless it is specifically required, piloting an engineering conversion programme, and paying for workers to develop the skills they need. See the case study on page 61 of the Annual Report 2022 for more information.

Collaboration for a just energy transition

A just transition to net zero requires genuine collaboration, which is why over 2021/22 SSE worked with a number of partners to progress this shared objective. In advance of COP26, SSE was one of a small group of global energy companies, led by the Council for Inclusive Capitalism and BP, which helped shape the Just Energy Transition Framework for Company Action. This Framework which was launched during COP26 is the first-ever guide for companies on concrete actions they can take to implement an energy transition that advances both social and environmental goals. The Framework’s building blocks for action are tied to Climate Action 100+’s Net Zero Benchmark Just Transition Indicator.

As a legacy of COP26, SSE led a group of global companies across the power sector to create the Powering Net Zero Pact with the principles of a just transition forming the basis of shared commitments. See pages 54 and 55 for information on this new world-first collaboration.

Scotland’s Just Transition Commission SSE’s Chief Sustainability Officer was one of the Scottish Government’s Just Transition Commissioners in its first iteration, which was created to gather evidence and advise the Scottish Government on actions to promote a just transition. The first report was published in March 2021, with a new iteration of the Commission set up later in 2021 to focus on delivery of these recommendations. SSE’s Chief Sustainability Officer sits in the Energy Sector workstream of the commission which exists to specifically scrutinise the country’s energy policy and strategy, and ensure that the just transition is fully integrated.

#1 globally

In November 2021, SSE was ranked the top company in the World Benchmarking Alliance’s just transition assessment which reviewed 180 global companies on their approach to just transition. SSE scored 14.46 points in the assessment, with the mean score across all assessed companies of just 7.74. Only 5% of companies scored above 8 points, with 84% of companies scoring <4 points and 3% companies scoring 0. SSE ranked #1 globally on all just transition fundamentals.

68 SSE plc Sustainability Report 2022

69 SSE plc Sustainability Report 2022
Paying a fair share of tax

At the highest level, society can address some of the distributional challenges of reaching net zero through a tax system where profitable organisations pay their fair share. SSE’s commitment to the principles of fair tax is well-documented, and this commitment will make an important contribution to achieving a just transition.

SSE has been accredited with the Fair Tax Mark since 2014, which means the Fair Tax Foundation has independently assessed it as having a responsible and transparent approach to paying tax, and that SSE explicitly rules out the use of tax havens or an aggressive approach to tax avoidance. SSE’s total tax contribution for 2021/22 is shown below, with more information found on page 58 of the Annual Report and within its Talking Tax 2022 report which will be published in autumn 2022.

Over 2021/22, SSE’s total tax contribution was £944m, split between £375m in taxes paid (including £70m paid in corporation tax) and £569m in taxes collected. This is a decrease of 5.5%, 5.6% and 5.4% respectively compared to 2020/21. This small reduction was the result of three key drivers:

1) 2020/21 tax figures include the tax contribution from SSE Contracting over the full financial year, whereas the disposal of this business in 2021/22 means that the tax contribution from SSE Contracting was only included up to 30 June 2021.

2) Environmental taxes paid were lower this year due to outages at some generation sites.

3) Environmental taxes collected were lower due to lower energy usage by business customers.

Sharing economic value

Creating and sharing value with society by adding economic value, investing in communities and supporting sustainable supply chains.

Contributing to GDP and supporting jobs

With an investment plan of £12.5bn between 2021 and 2026, SSE recognises that the way this money is invested can deliver significant economic benefits to the places SSE operates within. To understand its wider socio-economic contribution, SSE has commissioned PwC to measure the value it adds to GDP and the jobs it supports across its home markets for the last 11 years. Over 2021/22, SSE contributed a total of £6.2bn to the combined UK and Irish economies, supporting more than 47,000 jobs.

CASE STUDY

Investing in flexible low-carbon assets and generating socio-economic benefits

The next generation of flexible thermal power stations critical for meeting the UK’s carbon reduction targets include the Keadby and Peterhead Carbon Capture Power Stations which are being developed by SSE Thermal partner Equinor (see page 64). Investment in these technologies will present significant economic opportunities for communities and businesses. Over 2021/22, SSE commissioned BIGGAR Economics to analyze the potential socio-economic impact of Keadby and Peterhead carbon capture plants.

The Keadby Carbon Capture Power Station will be located in the Humber and analysis by BIGGAR Economics shows the project has the potential to generate £1.2bn for the UK economy over its lifetime. This is comprised of £470m which would be added to the UK economy through development and construction, with 7,300 years of employment supported. £570m will be generated for Yorkshire and Humber; and the East Midlands. On an annual basis once operational, the plant could contribute £53m to the UK economy each year and support 560 jobs.

The Peterhead Carbon Capture Power Station likewise showed the potential significant economic contribution of the project, totaling £1.2bn over its lifetime. It is estimated that the development and construction of Peterhead will add £470m to the UK economy, as well as 7,850 years of employment. On an annual basis once operational, the plant would contribute an average of around £50m to the UK economy and support 560 jobs. Of this, £390m could be added to the Scottish economy during development and construction, with 3,070 years of employment supported. Across the lifetime of the station, an average of around £35m would be added to the Scottish economy annually with 290 further jobs supported each year.

Analysis by BIGGAR Economics on the Peterhead Carbon Capture Power Station likewise showed the potential significant economic contribution of the project, totaling £1.2bn over its lifetime. It is estimated that the development and construction of Peterhead will add £470m to the UK economy, as well as 7,850 years of employment. On an annual basis once operational, the plant would contribute an average of around £50m to the UK economy and support 560 jobs. Of this, £390m could be added to the Scottish economy during development and construction, with 3,070 years of employment supported. Across the lifetime of the station, an average of around £35m would be added to the Scottish economy annually with 290 further jobs supported each year.

Supporting competitive, local supply chains

Core to a just transition is the maximisation of economic opportunity for people close to the places hosting renewables developments. An ongoing priority for SSE is to help create an environment where there is increased domestic content of projects, especially offshore wind developments. The ability to locally share the economic benefit of low-carbon investments through sustainable domestic employment, at scale, is a key component of delivering fairness. It means working people, particularly those currently in industries which are in decline, can access new skills and jobs. At the same time, this ambition must be balanced with the cost of delivering renewable power.

SSE believes that all levies should be used to achieve increased local content and more competitive domestic supply chains where infrastructure is being built. It is proactive in supporting policymakers and industry to work together, and has prioritised close collaboration with supply chain partners to bring about greater investment in the manufacturing of key components needed for its projects. Over 2021/22, key areas of progress included:

- As part of SSE Renewables’ successful ScotWind offshore wind bid, with its project partners it has committed to a £30m supply chain fund which will directly invest in ports and supply chains, including those companies transitioning from the oil and gas sector to get it ready for the floating wind opportunities not just in Scotland, but globally.
- SSE Renewables’ senior leadership team have taken leadership positions within industry bodies with the objective of supporting practical and actionable steps that will result in a sustainable domestic supply chain, capable of competing internationally. This includes: the Offshore Wind Industry Council, the Global Wind Energy Council, and the Scottish Energy Advisory Group.
- SSE led the creation of the Powering Net Zero Pact, a world-leading global initiative which brings the power sector together to collaborate on difficult areas of sustainability with the goal of achieving a fair and just transition to net zero (see pages XX and YY). One of the five working groups for signatories of the Pact to collaborate on is how to better support competitive, local supply chains close to assets.
- While voluntary action from developers is important in securing increased local content within projects, SSE believes there is an important role for government to both incentivise and regulate for increased local content. It continues to work closely with policymakers to develop policies that support local content, such as the UK Government’s CfD Supply Chain Plan. It is also collaborating with international partners to share lessons learned from the UK’s experience of growing local supply chains for onshore and offshore renewables.

Committed to decent work and economic growth

Investing in communities and promoting resilience

An integral part of a just transition is sharing value with local communities. SSE is one of the largest corporate grant givers in the UK and Ireland and, over 2021/22, distributed and donated over £11m to support more than 1,000 community projects.

The majority of SSE’s community giving comes from its SSE Renewables business, which for over a decade has provided communities close to its assets with funding for local or regional projects. SSE Renewables will invest over £310m locally in community funds from its current renewable projects over their lifetime. Over 2021/22, £9.7m was granted through SSE Renewables’ community investment funds (£500/21: £10.2m). This funding financed 1,048 community projects across the UK and Ireland, including 137 rural jobs, 96 scholarships and 108 community projects which enhance local net zero ambitions. £1.3m of this total investment in 2021/22 was from SSE Renewables’ flagship Sustainable Development Fund which helped fund 29 transformational Scottish and English projects. Detailed disclosure on SSE Renewables’ community funding can be found on sserenewables.com/communities.

In addition to this direct community investment through renewables projects, almost £500,000 was administrated to communities through SSEN’s Resilient Communities Fund, which prioritises projects which protect the welfare of vulnerable members of the community in SSEN’s network areas during significant emergency events. The fund aims to help improve local responses to emergency events by enhancing community facilities, services, and communication. Following the severe storms in winter 2021/22, SSEN announced it would also grant a further £1m through its Resilient Communities Fund. In May 2022, the fund received 140 applications which demonstrates the commitment and capability of local residents to respond to emergencies.

In addition to the SSE Renewables’ community investment funds and SSEN’s Resilient Communities Fund, this year SSE also donated £1m to the Disasters Emergency Committee (DEC) in support of humanitarian aid in Ukraine.

In 2022 SSE provided a grant of £1m to support Ukraine, via the Disasters Emergency Committee (DEC) Humanitarian Appeal. On 30 March 2022, a representative from DEC joined an SSE employee call to raise further awareness of the Ukraine crisis and the work the DEC are doing to help, which SSE’s donation supports. Donations to the DEC Humanitarian Appeal are reaching people in Ukraine and those who have fled to neighbouring countries, providing emergency aid and support via 13 charities. They are supplying essential items like food, water and shelter for displaced families, and medical support including incubators for babies in Ukrainian hospitals. In the first six months of the response the DEC aims to deliver £74.5m of aid, and continue to provide access to essential care, with the rest of the funds being spent over the next three years.

DILEMMA

Adapting community benefit funding

SSE Renewables’ community investment funds typically endure for 25 years with a common formula to calculate the value available to communities each year. In 2020, faced with a challenging landscape for developing new onshore wind farms in Great Britain, SSE Renewables made the difficult decision to change its onshore community benefit policy, adjusting the amount of community benefit for future onshore farms in Great Britain from £5,000 per MW of capacity to £3,000 per MW per year. Eighteen months on from this decision, and following changes in market conditions and representations from the communities themselves, SSE Renewables revised the decision and reverted its direct funding to £5,000 per MW for new onshore wind farm developments.

ENGAGEMENT IN ACTION

Supporting a community-led net zero transition

Communities are conscious about the climate crisis current and future generations are facing, and are exploring ways to reduce their carbon footprint to contribute to the net zero transition. In 2021/22, SSE Renewables increased its community funding for net zero projects, with 108 community projects receiving donations. These funds support projects ranging from electrifying community transport in the Scottish Borders, and air source heating in the Scottish Highlads, to using solar panels in Tuamafoula, Ireland. The momentum shows small steps by individual projects and communities can collectively make an important contribution to net zero.

Supporting Ukraine with the DEC Humanitarian Appeal

Encouraging the future generation into STEM careers

SSE Renewables, and partners Equinor and Eni, have invested £1m during the construction of Dogger Bank Wind Farm to help increase STEM attainment in Northeast England and Yorkshire. Local education and skills stakeholders have been consulted to develop initiatives to enhance local STEM programmes, which include introducing STEM learning into nursery education in East Riding of Yorkshire, and embedding STEM careers provision into every primary school in Redcar and Cleveland. In South Tyneside, 40 female and non-binary secondary school pupils participated in Sternettes Goals, an event that develops STEM skills and exposes participants to STEM careers and innovations. The sessions helped to increase their perception, awareness, confidence, and knowledge of STEM.
Committed to decent work and economic growth

Guaranteeing fair work

Investing today in the workforce of tomorrow by creating jobs, developing skills, and ensuring people are treated fairly and with respect.

Creating good, green jobs

Over 2021/22, SSE hired 3,195 roles through internal and external recruitment channels. This was an increase from 2,227 the previous year, reflecting growth of around 1,000 new jobs over the last year, a rate of growth expected every year to 2026, in support delivery of the £12.5bn Net Zero Acceleration Programme. These jobs will be located across all SSE’s operations and in all parts of the UK, with further growth expected. In SSE’s transmission business alone, 400 new jobs are expected to be created over the next year. Additional roles will also be created and supported through SSE’s supply chain activities. See page 75 for information on SSE’s approach to supporting competitive, domestic supply chains.

1,000 new jobs created in 2021/22

1,000 new jobs created every year to 2026

The ability of SSE, and the energy industry more widely, to secure sufficient talent required for the net zero transition is a key area of strategic focus. SSE is developing re-training programmes to widen its reach to those that want to join the green revolution. For SSE, this includes initiatives which have been developed over the year, including a pilot engineering conversion course in its networks business for those with an engineering background in different sectors and a returner programme for those coming back to the STEM industry after a career break, as well as significant investment in early careers programmes (see next page).

SSE is also committed to sustaining its current workforce by having a competitive employee value proposition where employees can see the benefits of being part of a purpose driven organisation that is focused on being the UK’s Green Energy Champion. A key part of this sustainable approach involves employee listening, where employee views are captured through engagement surveys, focus groups and exit interviews. Understanding employee sentiment and areas of required improvement is a key for ensuring employees feel valued and belong.

Ensuring these jobs, whether direct roles with SSE or through its supply chain, are good quality jobs is fundamental to a fair and just energy transition. Therefore, in line with the commitments outlined in its From Principles to Action: Supporting workers transition from high to low-carbon careers, SSE is committed to guaranteeing attractive standards for employees, including: a focus on health and safety performance; the right to freedom of association and collective bargaining; payment of at least a real Living Wage, accompanied by Living Hours, respect and incorporation of employee voice; the opportunity to work flexibly; ongoing investment in learning and development; a focus on increasing inclusion and diversity; a robust approach to business ethics with clear channels for whistleblowing.

Growing skills and talent

To develop its existing workforce for the net zero future, SSE seeks to simultaneously maintain current skills, whilst developing the new skills required. Accessibility, inclusion, and diversity are key aspects of creating the workforce with the right skills to reach net zero.

SSE’s investment in learning, training and development increased to £7.5m in 2021/22 from £6.8m in 2020/21. Average training hours per full-time employee also returned to near pre-pandemic levels (2021/22: 207, 2020/21: 9, 2019/20: 234), with 84.2% of SSE’s employees receiving some form of development over the year.

£7.5m investment in learning, training, and development (2020/21: £6.8m)

Embracing a Learning Culture

SSE’s response to the coronavirus pandemic helped accelerate a shift to more online learning approaches, using technology to further promote and develop an accessible and inclusive learning culture. This approach has been embraced across SSE’s businesses, with 80% of all training now delivered digitally.

Over 2021/22, SSE introduced a series of interconnected learning, SharePoint, providing self-paced resources to support complement formal learning offerings. This approach gives employees the opportunity to develop their knowledge at their own pace, prior to attending formal courses, and allows them to access information to maintain their skills, as and when required.

SSE made some improvements to IT infrastructure and tools to increase the accessibility of learning. This included using and promoting Office 365 capabilities, which allow learners to use a wide range of devices to view training materials. This enables employees to access training in a variety of formats and locations, allowing SSE to reach a higher proportion of its workforce. This is especially important as SSE’s business expands to have more remote workers.

“...“In my 30 years working in the electricity sector, I have never known a better place to join. SSE is involved in some of the most exciting project in the world right now – from building the world’s largest wind farm, to installing high tech transmission infrastructure. And we are looking for new talent to join us, people from all sorts of backgrounds and experiences, to help us provide the very practical solutions to the global climate challenge.”

John Stewart
Human Resources Director

Investing in early careers

Central to creating a workforce for net zero is promoting and encouraging new, diverse talent into early career positions. Investment in pipeline programmes increased to £9.8m in 2021/22 from £9.0m in 2020/21. The number of people on SSE’s pipeline programmes (apprenticeships, technical skills trainees, graduate trainees, programmes, graduate conversion programmes and other pipeline programmes) remained consistent with the previous year (2021/22: 470 individuals, 2020/21: 460 individual). SSE’s overall headcount decreased however in 2021/22 due to the disposal of non-core businesses, meaning an increase in the proportion of SSE’s workforce on a pipeline programme, rising from 3.8% to 4.3%. Focus on recruiting from a more diverse talent pool for pipeline programmes also increased the proportion of women across all of these programmes, overall increasing to 19% in 2021/22 from 11% in 2020/21.

Apprenticeships: with no minimum entry requirements, SSE seeks to attract individuals who can demonstrate seven key characteristics: drive, ownership, resilience, learning agility, safety consciousness, social adaptability and collaboration. SSE’s apprenticeship programmes offer opportunities to develop skills within engineering and wider business roles including Electrical, Jointer, Fitter, Energy, Power Network Engineer, Finance, Procurement and Data Science. While there is still a long way to go to have gender balance in SSE’s apprenticeship programme, the female proportion increased this year to 11% from 7% in 2020/21.

Trainee Engineers: for those who meet the minimum requirements, trainees can benefit from work-based learning whilst studying towards an HNC in Electrical Engineering or a Diploma of Higher Education in Engineering. Trainees undertake work placements to put their education into practice and gain practical, hands-on experience. The proportion of women on this programme increased from 11% to 23% between 2020/21 and 2021/22.

Graduates: SSE’s graduate IT and Engineering placements offer practical skills, with Engineering graduates also receiving relevant professional qualifications or charterships e.g. IMEICE, ICE and IET. SSE’s graduate opportunities across the business have one thing in common: across the two years of the programme, the graduates gain hands-on experience, build a valuable network and develop a unique set of skills to shape their career. Women made up 39% of SSE’s graduates in 2021/22, compared to 23% the previous year.

Employability programmes: these encourage social mobility and are designed to recruit talent from communities and social demographics that may not have otherwise applied to work in the energy sector. The programmes encourage the uptake of STEM subjects in education and include Teach First, Barnardo’s Works, SSE Works, and Career Ready. Over 2021/22, in-person work experience programmes have been reinstated, following the removal of coronavirus restrictions, with SSE welcoming 18 people onto the Barnardo’s Works programme during the past year to provide virtual work experiences that expose young people to the energy industry.

£9.8m invested in pipeline programmes (2020/21: £9m)

280 apprenticeships (2020/21: 363)

43 Trainee Engineers (2020/21: 53)

124 IT and Engineering graduate placements (2020/21: 56)
Committed to decent work and economic growth

SUSTAINABILITY REPORT

In addition to the £0.8m invested in early career programmes, SSE invested £1.7m over 2021/22 to sustain key skills across its workforce (2020/21: £6.8m). This reduction in spend is due to the impact of the coronavirus pandemic, which led to activities paid for in financial year 2020/21 being rescheduled to run in financial year 2021/22. A total of 9,704 people received training, which included 3,996 receiving technical skills training, 3,625 receiving safety training, and 2,083 receiving personal skills training.

£8.5m

investment over 2020/21 and
2021/22 to sustain key skills

SSE promotes an everyday learning culture, encouraging everyone to learn whilst carrying out their roles. The My Learning portal provides a variety of accessible resources which offer flexibility for learners to maintain and develop skills and knowledge that will benefit both current and future roles. The portal has continued to be developed over 2021/22, addressing learner feedback and improving the user experience. Development areas include personal and management skills, health and wellbeing, safety, and business ethics.

Developing leaders

SSE continues to build leadership talent that will sustain the growth of the business as it focuses on delivering a net zero future and takes on the challenges of an increasingly competitive marketplace.

2,569 leadership training events carried out (2020/21: 1,786)

A total of 2,569 leadership training interventions were carried out over 2021/22 (2020/21: 1,786). Development programmes are structured to support leaders as they progress through the stages of their career. Examples include the People Management Programme (PMP) and Inclusive Leadership Development Programmes (ILDP) targeting those new to leadership roles, and the Career Development Programme (CDP) aimed at senior talent development. Over 2021/22, 216 leaders attended the PMP, 95 attended the ILDP and 35 attended the CDP. Tailored leadership programmes are also available for each business area. They provide a combination of theory and practical activities designed to stretch participants as they practice and develop their skills. Tailored offerings supported 153 leaders through 2021/22. Business benefits include: increased staff engagement, improved communication, collaboration and learning across the teams, improved working practices; shared efficiencies and business improvement opportunities; and the identification of talent to aid succession planning.

Creating an inclusive workplace

The innovative solutions required to deliver net zero need a workforce with diverse perspectives, different experiences, and new skills.

Driving inclusion, powering change

Over 2021/22, SSE has refreshed its strategic approach to inclusion and diversity, recognising that this is an essential driver to deliver net zero in a way that is fair and affordable.

In 2021/22, SSE refreshed its Inclusion and Diversity Strategy by establishing four strategic areas of focus: (1) Ambition, setting measurable goals; (2) Education and Development, focusing on behaviours; (3) Inclusive Processes, embedding best practice; and (4) Employee Voice, actively listening. Actions to influence positive change are informed through collaboration with external partners to identify opportunities for further improvement, as well as listening to employee experiences. The refresh seeks to deliver greater inclusion and diversity across all levels of the company and embeds systemic and behavioural change; supporting the delivery of SSE’s IN, ON, UP approach, which it has been implementing since 2017. This approach, developed with inclusion expertsrainInclusion, focuses on attracting diverse talent IN, enabling them to stay ON, and supporting them to progress UP at SSE, by providing opportunities that are fair and transparent for all.

Reflecting its increased strategic focus, SSE has published a new comprehensive Inclusion and Diversity Report 2022, providing information on SSE’s updated Inclusion and Diversity Strategy, progress made, gender pay gap performance, and a range of key performance indicators for 2021/22. Read the report on sse.com/sustainability/reporting.

The 2021 Inclusion and Diversity Strategy pillars: SSE has developed four key areas of focus to deliver the IN, ON, UP ambition.

AMBITION

Setting measurable goals

Setting ambitions and KPIs, and using external benchmarking

EDUCATION AND DEVELOPMENT

Focusing on behaviours

Building leadership confidence and raising awareness for all to create an inclusive workplace

INCLUSIVE PROCESSES

Embedding best practice

Ensuring policies and processes are inclusive to support everyone

EMPLOYEE VOICE

Actively listening

Understanding what matters to employees to inform and shape the improvements needed

INCLUSION AND DIVERSITY IS AN ESSENTIAL PART OF THE JUST TRANSITION

The innovative solutions required over the next decade and beyond will need a workforce with diverse perspectives, different experiences, and new skills. SSE recognises that boosting inclusion and diversity is an essential part of a fair and just transition to net zero, and has therefore included this within the 20 principles of its Just Transition Strategy, forming a core part of its business strategy. SSE is working to attract people from declining high-carbon sectors alongside increasing diversity and inclusion within its business, which is why initiatives aim to be broad and inclusive to everyone. For example, industry-specific experience has been removed from job adverts to attract a more diverse pool of talent in all senses, including high-carbon professionals, and those from diverse backgrounds. For more information on SSE’s just transition approach, go to www.sse.com/sustainability/just-transition/
Committed to decent work and economic growth

2020/21 inclusion and diversity highlights

Publication of SSE’s Inclusion and Diversity Report 2022, providing more data and detail on its approach than ever before.

Revised senior leadership gender ambitions set to align with the FTSE Women Leaders Review (see more on page 65 of the Annual Report 2022)

SSE reaches a 50/50 gender split on its Board for the first time.

For more information on SSE’s 2020/21 inclusion and diversity ambitions, progress made over the year and key inclusion and diversity initiatives, see pages 64 to 65 of its Annual Report 2022 and its dedicated Inclusion and Diversity Report 2022, both of which can be found on sse.com/sustainability/reporting.

Measuring SSE’s ambitions

SSE has been tracking progress against a wide range of diversity metrics within the business since 2015, including the proportion of women, ethnic minority, disabled, and LGBTQI+ employees. For the first time, SSE has now published its ambitions to increase the proportion of employees with these diverse characteristics along with its ambitions to increase gender balance at a senior level.

1. In the context of gender reporting, the GEC includes all members of the GEC and the Company Secretary. This is the definition of senior managers in SSE for the purposes of S44(4)CR04
2. Employees in SSE’s senior level pay grades.

HELPING MIGRANT WOMEN COMMUNICATE TRANSFERABLE SKILLS TO ACCESS IRELAND’S JOB MARKET

In Ireland SSE ran the Knowledge Sharing Programme with support from Business in the Community, Ireland, to help migrant women living in Ireland secure a job that matched their skills and expertise. The women, from a range of backgrounds including Brazil and India, are highly qualified for engineering and environmental roles within energy companies. Since arriving in Ireland, due to recruiters and employers not being able to understand how their education and qualifications suit the Irish job market, they were missing out on relevant opportunities and accepting roles which did not match their capabilities.

To help these women obtain the right jobs, SSE took part in six sessions, across six weeks, with the participants, where colleagues across the business shared knowledge about the energy sector in Ireland on topics including: Irish energy policy, biodiversity, windfarm operations, and grid operations. SSE’s Human Resources team gave advice on applying for roles and offered to review participant CV’s to help them tailor their experience. In addition, members of Engineers Ireland provided advice on communicating overseas qualifications to Irish recruiters. The programme also provided the participants the opportunity to network and support each other. Subsequent to finishing the programme, four of the seven women have found employment in their fields, one as an engineer. The programme has been shortlisted for the PwC Business Post Sustainable Business Awards under the social and inclusion category.
Committed to decent work and economic growth

SSE’s gender pay gap
SSE is committed to providing open and detailed information about its gender pay gap. In 2016, SSE became the first FTSE company to publicly disclose this information. 2022 is therefore SSE’s seventh year of reporting its UK gender pay gap, and its second year of voluntarily disclosing its Ireland gender pay gap. Data in this section is as of 5 April 2022.

For SSE’s full gender pay gap breakdown and additional narrative, see page 26-28 and 34-35 of its Inclusion and Diversity Report (2022).

While its mean and median gender pay gaps in both the UK and Ireland reduced this year, they remain persistently high. SSE has determined two core reasons for its gender pay gap:
1. Low representation of women in senior and higher paid technical positions.
2. Fewer women than men applying for roles across all levels of the business.

Currently there are more men than women in the marketplace that are trained for SSE’s higher paid technical roles. This is due to a number of reasons, including historically the industry being male-dominated, and there being barriers to women taking up STEM education and following this through to technical STEM careers. SSE works to encourage more women into the STEM industry through its STEM Education Outreach Strategy, and its STEM Returners scheme, which enables people to return to STEM careers after a career. In addition, SSE is working to increase the proportion of women in its senior leadership, see page 81 for its ambitions and progress against these.

17% increase in women being hired in SSE’s Leadership Group*

| Gender parity can only be achieved if women make up an even proportion of roles at all levels in the organisation. At 5 April 2022, 28.6% of SSE’s UK workforce of 10,734 people were women (2021: 26.4%). The increase in the representation of women is seen across all four quartiles, with the upper quartile (most senior quartile) increasing by 15%. SSE is continuing to implement its Inclusion and Diversity Strategy, with a focus on improving the proportion of women at all levels in its business. Initiatives focus on bringing more women, and wider diversity into the business, enabling them to stay on, and supporting them to progress up to senior levels.

89.6% returned after maternity leave in 2022/23

83% of employees have the ability to work flexibly (2017: 36%)

To ensure everyone at SSE is compensated fairly, SSE has moved to a new skills-based reward system, which will create a better opportunity for all employees to move through the pay scales as they acquire new skills. Over 2021/22, SSE also worked with KPMG to better understand its employee data and the causes of its gender pay gap. This will allow the company to focus its future efforts to reduce the gap. This work is ongoing, and SSE expects to report the findings during the 2022/23 reporting cycle.

SSE has voluntarily disclosed its Ireland gender pay gap since 2021, calculated in line with the UK Gender Pay Gap methodology, based on a snapshot date of 5 April. The figures below follow this approach for 2022. In May 2022, the Irish Government launched new mandatory requirements for calculating the gender pay gap in Ireland, which will require companies to use a June 2022 snapshot date and report this data publicly by December 2022. The June 2022 snapshot is beyond the last practicable day for inclusion in the Annual Report 2022 (being 24 May 2022), but SSE confirms the data will be reported in line with stated December deadline.

SSE is committed to creating an inclusive and diverse workforce across all its operations. For SSE Atricity, part of SSE’s business in Ireland, 100% of all roles are advertised as having the ability to work differently. As part of SSE Ireland’s commitment to Business in the Community Ireland’s Elevate Pledge, over 2021/22 SSE ensured that all Hiring Managers completed an inclusive recruitment upskilling programme to understand how to be consciously inclusive. The commitment over 2022/23 will be to collect social mobility data. SSE’s Inclusion and Diversity Strategy includes it’s Irish business and details how SSE are increasing the representation of diversity in its business can be found in SSE’s Inclusion and Diversity Report 2022.

Proportion of women per Quartile Y-O-Y (2021-2022)
Committed to decent work and economic growth

Getting everyone home safe

Underpinning everything SSE does is a foundation of guaranteeing a safe place to work for employees and those who work on behalf of SSE.

The safety of everyone

The safety of everyone who works for SSE, and the people who come into contact with the Company, is a long standing priority. In 2017, SSE introduced a simplified way of talking about safety and health and practical steps by which employees and contractors can enable SSE’s safety licence, “It’s not safe, we don’t do it”. With this Safety Family, culture now firmly embedded, a new safety and health Vision 2022+ programme builds on a simple concept - setting teams up for success by making it easier to do the right thing, so that everyone gets “Home Safe”.

SSE seeks to understand underlying employee sentiment towards safety and the annual employee-survey undertaken in summer 2021 found that safety was recognised as the number one priority for SSE colleagues and SSE’s licence “It’s not safe, we don’t do it” is something that SSE colleagues live by. Since 2017 there has been a decline in both the number of incidents and the incident rate. However, 2021/22 has presented challenges, such as, a 30% increase in the hours worked by contract partners, an increase in project activity, and multiple coronavirus restrictions leading to an increase in SSE’s incident rate for the first time in many years, from a Total Recordable Injury Rate (TRIR) of 0.15 per 100,000 hours worked in 2020/21 to 0.17 in 2021/22.

Ensuring robust governance and management of safety and health

SSE has an integrated management system covering occupational health and safety risks, major accident hazards, health and wellbeing, and environmental management.

SSE’s management system is certified to the internationally recognised standards ISO 45001 Occupational Health and Safety Management and ISO 14001 Environmental Management. In 2020/21 SSE extended ISO 45001 certification to Gas Storage, Thermal, SSE Renewables Operations, Embedded UK, and Thermal in Ireland. This is in addition to SSE plc and SSE Enterprise Utility Solutions. The ISO 14001 and ISO45001 certificates are publicly available at sse.com/sustainability. With 15 Management Standards it provides a framework across all business areas to deliver safe, sustainable operations, and continual improvement in performance. It also comprises 45 Risk Standards that set out SSE’s approach and compliance with legislation for the wide range of safety, health, and environment (SHE) risks impacting the extent of work activities undertaken.

Accompanying this comprehensive set of standards are supporting documents, audit protocols (enabling determination of conformance with SSE SHE standards), Training Briefs, and Employee Risk Card summarising key points for all employees to manage risks in their day-to-day work activities.

Robust processes and governance are in place in SSE’s business units and the Group SHE team develop annual SHE plans, to oversee the performance and progress made to address specific risks such as new technologies and entering new regions.

Across SSE we have a very simple goal – that we all get home safe having taken care of people and the environment. This is reinforced throughout our systems, making it easy to do the right thing, and our culture. Across SSE our communities have a real pride in what we do and a commitment to our licence, ‘if it’s not safe, we don’t do it.’

Mark Paterson
Safety, Health and Environment Director

The Safety Management and ISO 45001 licence are underpinned by SSE’s SHEC cultural programme, a holistic approach to health and safety, which includes the development of SSE’s SHE strategy to drive improvement in performance and risk management across the SSE group. This is evidenced by the improvements made through programmatic and the steps taken to launch SSE’s Home safe programme. The SHEC has been able to review the good progress on key SHE metrics and in line with its terms of reference, review specific risk areas.

In addition, the Sustainability, Safety, Health, and Environment Advisory Committee provides additional oversight. It is formed by members of the Board and Non-executive Directors.

Managing safety and health risk across SSE

To ensure risks are identified, managed, and mitigated by SSE’s business units and relevant contractor partners, who sit closest to the risk, every employee, supervisor, and manager needs to fulfil their responsibilities for their safety, the safety of others, and the safety of the environment.

SSE undertakes an assurance audit programme across the business, focussing on the management of SSE’s risks. Where gaps or non-conformance against SHE or Risk Standards are identified, improvement actions are developed and tracked to completion. In addition, SSE reviews Group SHE risks annually including occupational health, process safety, operational safety, and environment risks. This review is undertaken by the SHE Leadership team and the SHE Committee to ensure that risks are addressed adequately in each business units’ SHE plans.

Annual safety and health reviews are completed by both SSE Group and its business units to assess performance, the changing internal and external environments, technology, and any incidents over the previous year. These wide-ranging reviews form part of safety and health Governance, and the process for controlling SSE’s SHE risks.

Taking care of employees

Over 2021/22, SSE increased its focus on health and wellbeing. To reduce employee’ risk of getting seriously ill from coronavirus, SSE continued informing and encouraging its employees to proactively make healthier lifestyle choices. This included encouraging people to quit smoking, reduce alcohol intake, eat healthier, and exercise more, and SSE has a number of employee benefits that can help employees achieve these goals, such as gym memberships and health screening.

In addition to physical health, the pandemic has had a significant impact on mental health. Changes to working conditions can cause additional stress and anxiety, and working from home full-time can cause feelings of loneliness and depression. Therefore, in 2021/22, SSE implemented several mental health initiatives. These included engagement around Time to Talk, Mental Health Week, and Workplace Mental Health Day to help eradicate the stigma around poor mental health, and encourage people to feel comfortable and comfortable seeking support. Post pandemic, SSE continues to support colleagues as they return back to the office through a flexible first policy.

To support employees on key issues that affect wellbeing, SSE launched employee belonging groups where colleagues support and learn from each other. Groups include Chronic Health and Disabilities, Menopause and Inclusion, and Diversity topics. For more information on SHEC’s belonging communities, see SSE’s inclusion and Diversity report on sse.com/sustainability/reporting.

SSE provides employee access to support services for mental health including Nuffield Health, which is a self referral service, giving access to specialist musculoskeletal support, and care and counselling services for anxiety, depression, and stress. SSE has an Employee Assistance Programme (EAP) and provides access to Care First’s EAP which helps provide support for life’s challenges. SSE has over 330 trained mental health first-aiders available to talk with colleagues to provide confidential support for anyone in the business and to signpost where additional support can be provided. For more details on employee benefits, see page 61 of SSE’s Annual Report 2022.

Making the uncomfortable comfortable

Over 2021/22, SSE led a number of initiatives to encourage employees to come together to share their personal health stories with the aim of removing the taboo around health conditions and to make uncomfortable conversations comfortable.

Subjects include: mental health, which SSE has prioritised as part of its health and wellbeing focus, reinforcing that it’s ok to be open, no moniker, which although has a significant proportion of the population in their lifetime, is another condition that people struggle to talk about even though talking and relating to each other can be a great source of comfort; and cervical cancer, which affects those suffering and their family and friends.

SSE aims to encourage employees to have these conversations with each other and share lived experiences to identify they are not alone, and to step forward and seek help if required. Initiatives to encourage discussion included webinars with SSE’s external health provider on key topics such as cancer, stress, mental health, and mental fitness, as well as, encouraging employees to talk via SSE’s seven belonging groups, and by sharing on SHEC social media and at SHEC groups such as the email bulletin and safety net (an internal intranet site). One

SSE plc Sustainability Report 2022
Protecting and enhancing the natural environment

The decline in nature is one of the biggest challenges facing society and SSE has a responsibility to ensure that it preserves and enhances the value of the environments in which it operates.

While the greatest threat to nature is from climate change, ecosystems and biodiversity are affected by human behaviour in other ways too. Overuse of resources, land encroachment and pollution are combining with climate change to create a natural environment emergency that is described as profound to human life as global warming. SSE operates in some of the UK and Ireland’s most remote areas which are home to a wide variety of valuable ecosystems and habitats. Its Environment Strategy is designed to ensure that environmental impacts are considered throughout SSE’s operations and are carefully managed.
Embedding effective environmental management and governance

The careful management of environmental impacts is in part achieved through embedding robust policies and procedures to ensure that local environments are protected.

SSE’s Environment strategy
In 2021/22, SSE refreshed its Environment Strategy to ensure its environmental objectives remained stretching and its approach ambitious. The Environment Strategy provides a guide for its businesses when undertaking their daily activities and seeks to ensure that the environment in which it operates is protected and, where possible, enhanced.

The strategy has three pillars – responsible production and consumption; and, the natural environment – which are underpinned by an ethos of compliance. As part of this strategy, SSE has a robust environmental management system supported by governance at both the Executive and Board level – the Safety, Health and Environment Advisory Committee (SSHEAC) and the Safety, Health, Environment and Efficiency Committee (SHEC), respectively.

SHEC is SSE’s Environment governance at both the Executive and Board level, cements its prominent reputation in environmental sustainability.

In November 2021, SSEN Transmission was awarded ‘leadership’ status for environmental incident data using Power BI aims to identify trends and opportunities for improvement, investment and innovation. A breakdown of environmental incidents by severity can be found on page 88.

Effective environmental management
To ensure effective environmental management, SSE operates an environmental management system (EMS) certified to ISO14001, including controls, processes and procedures, across all its business activities that interact with the environment. All SSE businesses are covered by SSE’s EMS. In the last 12 months, SSE was externally audited and has maintained existing ISO14001 accreditation, and plans to extend accreditation to SSEN Distribution, SSE plc Sustainability Report 2022

Leading environmental performance
SSEN Transmission submits environmental disclosures to the energy regulator, Ofgem, on an annual basis, to monitor performance and drive improvements. In November 2021, SSEN Transmission was awarded ‘leadership’ status for Environmental Discretionary Reward (EDR) submission, achieving its highest score to date. SSEN Transmission is the only GB transmission owner to be awarded the prestigious ‘leadership’ status for four consecutive years, cementing its prominent reputation in environmental sustainability.
Enhancing the natural environment

SSE supports the conservation, restoration and sustainable use of land and water resources; and promoting the integration of amenity, ecosystem and biodiversity improvement into business activities.

Increasing ambition on biodiversity

SSE operates in some of the UK and Ireland’s most remote areas which are home to a wide variety of valuable ecosystems and habitats. SSE works to actively manage its environmental footprint and take careful consideration of biodiversity in its activities to ensure that it maximises positive and minimises negative impacts. In support of this, in 2021/22, all SSE Business Units committed to achieving no ‘net loss’ in biodiversity by 2023 and ‘net gain’ in biodiversity by 2025 on onshore Large Capital Projects.

More information on SSE’s approach to biodiversity can be found in SSE’s Annual Biodiversity Report, available at sse.com/sustainability. The report highlights the work SSE has undertaken to protect and enhance biodiversity, contribute to biodiversity research and knowledge, and connect people with the natural world.

SSE is targeting Biodiversity Net Gain by 2025

On all onshore Large Capital Projects

PARTNERING IN ACTION

Partnering to restore peatland habitats

A collaborative approach with communities, landowners and experts ensures the most effective outcomes for nature. In recent years there have been major declines in the extent of the UK’s blanket bog habitat, its largest terrestrial carbon store, principally due to afforestation, drainage, burning and overgrazing. More than a fifth of Scotland is covered by peat, storing approximately 4.5 billion tonnes of carbon. Peatlands are home to a wide range of rare, threatened, or declining habitats and species.

SSE Renewables actively manages peatland across ten operational wind farm sites and their associated Habitat Management Plan (HMP) areas in Scotland, have completed 1,678 hectares of restoration, with a further 330 hectares in progress on operational and construction sites and have identified over 2,500 hectares for future restoration projects, under proposal. At Dunmaglass Wind Farm*, a key aim of the Nature Conservation Management Plan (NCMP) is to restore and enhance areas of blanket bog across the site. Work to date has focused on restoring circa 25ha of peatland utilising specialist, skilled contractors employing innovative re-profiling and restoration techniques. At each stage in the process, these works have been undertaken collaboratively with the Dunmaglass Estate who have also contributed their own funding to enable additional areas of peatland to be restored. There are varying types of peatland erosion on site, and this requires a variety of restoration techniques to be employed including hag re-profiling and cross-tracking.

The success of these restoration techniques will be assessed in line with a commitment to long-term habitat monitoring for the operational lifespan of the site. In addition, SSE Renewables are actively investigating additional monitoring opportunities for blanket bog restoration across operational assets to better understand how to maximise the value of these projects and contribute to delivering positive effects for biodiversity.

Leading calls to limit North Sea sandeel fishing to support the seabird population

Through 2021/22, SSE Renewables has led a campaign to limit sandeel fishing within UK waters in the North Sea. Sandeels play a key role in the health of the North Sea’s marine ecosystem, acting as a food source for vulnerable marine species. However, due to the increasing effects of climate change and industrial fishing, the sandeel population has experienced significant declines in recent years which is negatively impacting several species of birds, particularly the black-legged kittiwake.

SSE Renewables is working alongside the UK and Scottish Governments and other stakeholders to improve how Scottish sandeel fisheries are managed to both help restore the health of the wider marine ecosystem and allow for the development of offshore wind projects. This includes its proposed 4.1GW Berwick Bank wind farm project located in the outer Firth of Forth.

Berwick Bank will be one of the largest offshore renewable energy developments in the world and delivering it this decade is critical to meeting the UK and Scottish Governments’ 2030 offshore wind targets and tackling the climate emergency. However, it is in an area that contains many important bird populations and legally protected colonies. SSE Renewables is seeking to implement a nature positive approach to the management of sandeel fisheries, with a view to improving seabird populations whilst also supporting efforts to develop sustainable fishing over the longer term.

SSE Renewables' NCP is to monitor for the operational lifespan of the site. In addition, SSE Renewables are actively investigating additional monitoring opportunities for blanket bog restoration across operational assets to better understand how to maximise the value of these projects and contribute to delivering positive effects for biodiversity.

* Dunmaglass Wind Farm is a joint venture between SSE (51.1%) and Greencoat UK Wind Plc (49.9%)
Protecting and enhancing the natural environment

Working together to develop nature-based solutions
For SSEN Distribution, 2021/22 has been a year of listening and learning. Stakeholders have been instrumental in building the RIIO-ED2 business plan and setting its high standard of ambition, by encouraging SSEN Distribution to be bold but credible with target setting and to create a transparent and ethical pathway to net zero. In addition to setting 5°C science-based carbon targets, SSEN Distribution is proposing nature-based solutions (NbS) for carbon removal and biodiversity, at a scale it’s not yet attempted.

Stakeholder input to nature-based solutions
SSEN Distribution listened to over a hundred stakeholders in 2021/22, including consumers and nature specialists to understand how a credible NbS proposal could be developed. The careful management of investments and interventions locally was prioritised by SSEN Distribution and stakeholders, who were averse to prioritising carbon, improve focus on biodiversity, and setting and to create a transparent and ethical pathway to net zero. In addition to setting 5°C science-based carbon targets, SSEN Distribution is proposing nature-based solutions (NbS) for carbon removal and biodiversity, at a scale it’s not yet attempted.

SSEN Distribution is proposing to deliver 2,000ha of woodland restoration and 2,200ha of peatland restoration, which is expected to remove over 300,000 tCO2e and provide 3,000 biodiversity units by 2045*. *Subject to Ofgem support.

As the world races to address the climate emergency, it risks forgetting the nature crisis. They are both so inextricably linked that we must work to solve them together. The catastrophic consequences of climate change are already being felt and our lack of action in previous years means that more drastic measures are now needed. Investing in nature is about our survival – nature can bounce back, but it needs to be now.

Shirley Robertson
Head of Environment, Consents, and Sustainability Strategic Policy
SSEN Distribution

Carbon removal and nature-based solutions
Carbon removals feature in SSEN Distribution’s net zero plans. SSEN Distribution believes there is still work to be done to demonstrate legitimacy and transparency in the carbon trading market, to ensure no further risk is placed on the consumer. The delivery of carbon reductions via NbS has uncertainty factors, however, there are a range of wider environmental benefits that can also be delivered: the enhancement of natural capital and delivery of multiple ecosystem services.

There is an emerging market for biodiversity units. Natural England's Biodiversity Metric 3.0 is being used to calculate the units required to deliver the soon to be mandatory 10% Biodiversity Net Gain for new developments in England. In turn, this has resulted in a trading market for biodiversity units. While Scotland has not yet adopted Natural England's metric and model, SSEN Distribution has used it as a proxy for measurement in England and Scotland. It has also explored the latest industry figures for the market value of biodiversity.

Investments of this nature take time to mature, they are not instant, or a quick fix, however once developed they will deliver richly over a 100-year span and beyond. Initial investment requirements rise significantly the sooner the results are needed. The need for immediate investment is clear, to ensure adequate maturity for net zero delivery, and to control and manage costs.

Connecting people with nature
The importance of connecting with nature and having access to outdoor spaces was heightened during the coronavirus pandemic, and it remains essential for people’s physical and mental wellbeing. Many of SSE’s assets provide recreational amenity, for example Galway Wind Park in Ireland has a series of recreational trails open to the public called the Galway Wind Way.

In 2021/22, SSE Renewables further supported communities to connect with nature through its community investment funds, which awarded almost €900,000 in Galway Wind Park and Cobbs Road to maintain and develop wildlife trails including biodiversity enhancement initiatives, and almost £90,000 to purchase and maintain a community woodland at Clyde Wind Farm.

Putting a spotlight on nature
2022 has the potential to be a turning point in the response to the nature emergency, in particular changes to how nature is valued. With a spotlight on nature at COP26, SSE Transmission hosted a Biodiversity Net Gain seminar in Glasgow with government, NGO and business stakeholders. Chaired by the Director of WWF, the panelists discussed the interconnectedness of the nature and climate crises and why they must both be tackled together as well as exploring how businesses can help achieve Biodiversity Net Gain outcomes.

SSE plc Sustainability Report 2022
SSE's responsible consumption and production strategy
SSE is working towards more sustainable patterns of resource consumption; reducing reliance on non-renewable and single-use materials and linking to the objectives of UN SDG 12.

In responsible consumption and production, SSE have rationalised its recycling and resource recovery service providers to single national providers for both UK and Ireland. This allows SSE to ensure consistent management across our business and to improve improvement in recycling, diversion from landfill, reporting and application of circular economy principles.

SSE has waste management controls within each of its businesses to follow the waste hierarchy to prevent, reduce, reuse and recycle its waste. It provides recycling facilities at its key offices and operational sites and adheres to the relevant regulatory requirements for waste management at its different sites and locations.

Over 2021/22, SSE made important progress on elements of its responsible consumption and production strategy. This includes:

- Improving governance: this has been achieved through Group and Business Unit level Circular Economy Action Groups reviewing monthly performance, driving compliance against new targets and identifying improvement opportunities to apply the waste hierarchy and circular economy principles.
- Rationalising its waste management supply chain: SSE now works with one main supplier in the UK, and one in Ireland. This allows it greater oversight of data and management of waste.
- Improving reporting of data: SSE now reports waste data monthly via a Power BI report.
- Setting waste management targets: SSE set new Group and Business Unit waste management targets for 2022/23 to minimise waste to landfill and to promote increased recycling of discarded materials. Subsequent 2021/22 performance and improvements in data and accuracy meant that SSE exceeded these targets at Group level in the same financial year. SSE is reviewing its data sets to drive improved performance across all Business Units.

SSE’s annual waste management targets are a minimum of:

- 85% of waste by tonnage diverted
- 40% of waste by tonnage recycled

Understanding SSE’s resource efficiency data
In 2021/22, SSE managed 5,267 tonnes of waste, around 148 tonnes of which was hazardous waste. The increase in the reported total of waste from 2,321 tonnes in 2021/22 is mostly due to improved accuracy and scope of data including additional information from national suppliers like data on metal recycling, that was previously unavailable. The majority, 59% of SSE’s total waste recorded was recycled and a quarter was sent to energy from waste. More detail of the waste disposal methods of SSE’s recorded waste in 2021/22 can be seen in the chart below. The figures provided represent SSE’s operational waste, and don’t include waste data from contractors on large infrastructure projects or minor works contracts, however, plans are in place to begin compiling this data and a reporting tool is being trialed in the renewables and transmission business units.

Disposal methods of SSE’s recorded waste 2021/22 by proportion:

SSE provided more detail on water risk management and performance in its annual CDP Water Programme response. SSE received a ‘A’ rating for its 2021 submission, which is publicly available at sse.com/sustainability.

Managing air emissions
In 2021/22, SSE’s thermal generation sites emitted 4,573 tonnes of nitrogen oxides (NOx), compared to 4,281 tonnes the previous year, an increase of around 7%. Emissions of sulphur dioxide (SO2) more than doubled to 3,021 tonnes, from 1,379 tonnes the previous year. In addition, particulate emissions (PM10) rose to 277 tonnes, from 182 tonnes in 2020/21, and mercury emissions to air decreased significantly from 19.4kg in 2020/21 to 1.9kg in 2021/22.

The rising trend across these three key air emission sources reflects the increased demand for oil-fired peaking plant in Ireland that was a result of the need to balance the grid.
Reducing the impact of SF₆
Sulphur hexafluoride (SF₆) gas has been used extensively across the electrical industry due to its insulating and interruption properties, making it possible to reduce equipment size and improve reliability and safety. However, SF₆ is a greenhouse gas that is 23,500 times more harmful to the Earth’s atmosphere than CO₂ which, if released, stays in the atmosphere for over 3,000 years. It is used as an insulating gas for switchgear in substations and its lifecycle management requires careful handling, particularly when decommissioning ageing substations.

SSE’s ‘Thermal, Transmission and Distribution businesses’ use SF₆ in their operations and have specific procedures for managing, monitoring and reporting SF₆ leakage as well as initiatives to prevent and reduce SF₆ leakages from their operations.

In 2021/22, SSE’s SF₆ emissions increased slightly to 315kg from 295kg in the previous year. Whilst SF₆ leakage reduced in SSE’s Transmission and Distribution businesses, SF₆ leakage increased slightly due to equipment failures. These have all been assessed, repaired and actions put in place to mitigate these in the future.

For SSE’s Transmission and Distribution businesses, SF₆ leakage has an impact on their operations and these businesses have a number of initiatives to prevent and reduce SF₆ leakages from their networks.

Managing SSE’s energy consumption
Between 2020/21 and 2021/22, the energy SSE purchased for use in its assets (offices, depots, thermal power stations, gas storage facilities and data centres) fell by around 16%, from 234GWh to 196GWh. This reduction was largely due to a fall in electricity consumed at the now closed Riddletown coal-fired power station, as decommissioning activity reduced, and a reduction in energy consumption at SSE’s Ashdore gas storage facility.

For the price control period 2023 to 2028, SSE will revise its annual reduction target to match operational requirements.

Reducing GHG emissions from networks
Over 2021/22, SSE Transmission has continued its work on SF₆ alternatives. SSE Transmission worked with the GE and Amey consortium to energise its first SF₆-free gas insulated substation on its network using C4-FN* technology, as part of the New Deer project in Aberdeenshire. This is the world’s largest installation to date of this type of SF₆-free gas.

In addition, the first SF₆-free Siemens ‘Clean Air’ Power Voltage Transformers were installed on the GB Transmission network at the new Glen Tiffany substation near Tomatin in the Scottish Highlands.

SSE Transmission also has plans to install g³ switchgear at their Kintore 400kV substation, in Aberdeenshire, which will be the first time globally that SF₆-free gas insulated switchgear will be used at this voltage level. SSE supported GE in obtaining EU lifeGRID project funding. Over 2021/22, it awarded some key contracts for the project and construction works began in June 2021.

* g³ is a C4-FN is a gas mixture based on carbon dioxide, oxygen and 3M™ Novec™ 4710 Dielectric Fluid from the 3M fluoronitrile family.

It has become apparent in recent years that the rate of SF₆ leakage from the ageing asset base installed across all GB Distribution Network Operators (DNOs) has been increasing. Therefore, it has been necessary for all DNOs, to develop and implement SF₆ leakage mitigation strategies.

Over the year, SSE Distribution continued to implement its strategy to minimise switchgear SF₆ leakage, which includes a pro-active approach to its SF₆ switchgear repairs process and it has targeted innovation at leak detection and repair, as well as trialling alternatives. In December 2021, SSE Distribution finalised its RIO-ED2 Business Plan which outlines its enhanced SF₆ leakage reduction strategy for the price control period 2023 to 2028.

SSE Transmission continues to work with suppliers to use new, more environmentally friendly gas insulated equipment by installing SF₆ alternatives across its electricity network in the north of Scotland. To date SSE has energised five substations with two distinct SF₆-free alternative technologies, installing SF₆ alternatives, where technically viable, in “new” business as usual for SSE Transmission.

Externally, SSE Transmission and Distribution are taking active roles in addressing the issue of SF₆ and are part of the Energy Networks Association SF₆ (IIG) Strategy group.

Protecting and enhancing the natural environment
Reducing GHG emissions
Reducing the impact of SF₆
SSE’s renewables business use negligible quantities of SF₆ in operations, these are not included in reported KPIs

SSE plc Sustainability Report 2022
SSE plc Sustainability Report 2022
Data and performance

SSE is committed to transparent and open reporting of current and historic non-financial data.

This section provides additional disclosures of SSE’s sustainability performance measured against key internal and external frameworks, as well as the Limited Assurance opinion on select environmental data point mentioned throughout this report.

The following additional information on performance can be found at sse.com/sustainability.

**Sustainability data tables**
Detailed environmental, social and economic data is available to download from SSE’s website. More detail on SSE’s gender pay gap and diversity information can be found in SSE’s Inclusion and Diversity Report 2022.

**GHG and water criteria documents**
The criteria document details the reporting approach SSE uses to disclose GHG and water-related information related to its operational activities. The criteria is updated annually.

**Gender pay gap information**
SSE’s UK and Irish gender pay gap information is available to download on SSE’s website. More detail on SSE’s gender pay gap and diversity information can be found in SSE’s Inclusion and Diversity Report 2022.

**Group Policies**
SSE makes key sustainability-related Group Policies publicly available on its website, outlining SSE’s approach to promoting a healthy business culture and guiding decisions and actions as expected by its stakeholders.

**Modern slavery statements**
SSE’s Modern slavery statements set out the steps taken by SSE to identify and prevent modern slavery and human trafficking existing within its business and supply chains. All statements since 2016 are available to download.

**ISO certification**
SSE’s ISO 14001:15 (Environmental management systems) and ISO 45001:18 (Occupational health and safety management systems) certificates are available to download from its website.

---

Sustainability - Linked Executive Remuneration

The Annual Incentive Plan (AIP) for SSE’s Executive Directors for 2021/22 was evaluated against several sustainability measures, including progress made against the company’s 2030 Goals. The below table summarises the performance outcome for the key non-financial performance measures included in the AIP of ‘Stakeholders’ and ‘Contribution to the UN Sustainable Development Goals’.

<table>
<thead>
<tr>
<th>Contribution to the UN Sustainable Development Goals (20% of AIP)</th>
<th>Outcome</th>
</tr>
</thead>
<tbody>
<tr>
<td>Climate action (5%): Take urgent action to combat climate change and its impacts</td>
<td>Reduce the carbon intensity of electricity generated by 60% by 2030, compared to 2017/18 levels, to around 153gCO2e/kWh.</td>
</tr>
<tr>
<td>Affordable and clean energy (5%): Affordable, reliable and sustainable energy for all</td>
<td>Develop and build by 2030 more renewable energy to contribute renewable output of 30TWh a year.</td>
</tr>
<tr>
<td>Industry, innovation and infrastructure (5%): Build resilient infrastructure, promote inclusive and sustainable industrialisation and foster innovation</td>
<td>Build electricity network flexibility and infrastructure that helps accommodate 10 million electric vehicles in GB by 2030.</td>
</tr>
<tr>
<td>Decent work and economic growth (5%): Promote sustained, inclusive and sustainable economic growth, full and productive employment and decent work for all</td>
<td>Be the leading company in the UK and Ireland championing Fair Tax and a real Living Wage.</td>
</tr>
</tbody>
</table>

<table>
<thead>

The three-year review cycle of the Remuneration Policy means that it will be subject to binding shareholder vote at SSE’s 2022 Annual General Meeting. The Remuneration Committee is seeking to use this review to strengthen and align the approach to pay with SSE’s purpose and long-term strategy. This will include an increased emphasis on sustainability overall, with a proposal to include sustainability measures in the longer-term Performance Share Plan, whilst also retaining an in-year focus on sustainability progress by including a smaller element within the AIP.

Further detail on the performance outcome for 2021/22 and the proposed changes to the Remuneration Policy can be found within the Remuneration Committee Report in SSE’s Annual Report 2022, on pages 186 to 189 and 172 to 182 respectively.
### Table 1. Sustainability Disclosure Topics & Accounting Metric

</thead>
<tbody>
<tr>
<td>(1) Gross Global Scope 1 emissions, percentage covered under (2) emissions-limiting regulations, and (3) emissions-reporting regulations</td>
<td>SSE's generation activities in the UK are subject to the UK ETS and the carbon price Support and in Ireland they are subject to the EU ETS (see page 29). SSE is required to report its GHG emissions and energy consumption in the UK through the Companies (Directors’ Report) and Limited Liability Partnerships (Energy and Carbon Reporting) Regulations 2018 and the Streamlined Energy and Carbon Reporting (SECR) requirements. Information disclosed in the accompanying data and performance tables (available at sse.com/sustainability/reporting), alongside pages 54 to 55 of SSE’s Annual Report 2022 represent SSE’s disclosure against these requirements.</td>
</tr>
<tr>
<td>Greenhouse gas (GHG) emissions associated with power deliveries</td>
<td>As of January 2020, SSE Energy Services, the retail division of the SSE Group, was sold to Octopus Energy. This ended the direct supply of electricity from SSE to households customers in Great Britain. Scottish and Southern Electricity Networks (SSEN) maintain responsibility for the distribution of electricity across central southern England and the north of Scotland, as well as the electricity transmission network in the north of Scotland. Details of the emissions associated with the losses within our networks are disclosed in the accompanying data and performance tables (available at sse.com/sustainability/reporting).</td>
</tr>
<tr>
<td>Discussion of long-term and short-term strategy or plan to manage Scope 1 emissions, emissions reduction targets, and an analysis of progress against those targets</td>
<td>Two of SSE’s science-based carbon targets cover SSE’s scope 1 (GHG) emissions. Discussion on trends and progress towards these targets can be found on page 26.</td>
</tr>
<tr>
<td>Number of customers served in markets subject to renewable portfolio standards (RPS) and (2) percentage fulfilment of RPS target by market</td>
<td>SSE’s customer facing businesses only serve customers in the GB market and the island of Ireland. Single Electricity Market. Both these energy markets have mature carbon reduction and renewable support frameworks. In Ireland, there are government targets on particular forms of renewable energy (e.g., for onshore wind by 2030 and, in the UK, renewable targets support capital budgets. Neither market has standards that mean electricity generators must secure a proportion of their portfolio of energy generation from renewable sources.</td>
</tr>
<tr>
<td>Air emissions of the following pollutants: (1) NOx (excluding N2O), (2) SOx, (3) particulate matter (PM2.5, PM10), (4) lead (Pb), and (5) mercury (Hg); percentage of each in or near areas of dense population</td>
<td>SSE disclosed NOx, SOx, PM2.5 and Mercury emissions on page 95 of this report and in the accompanying data and performance tables (available at sse.com/sustainability/reporting). Data from other air emissions is reported to the environmental regulator and, whilst this information can be accessed through a request to the regulator, SSE is working to disclose it more readily to its stakeholders in future.</td>
</tr>
<tr>
<td>Total number of nuclear power units, broken down by U.S. Nuclear Regulatory Commission (NRC) Action Matrix Column</td>
<td>N/A - SSE does not operate nuclear generation.</td>
</tr>
<tr>
<td>Number of incidents of non-compliance associated with water quality and/or quality permits, standards, and regulations</td>
<td>In 2021/22, SSE had three minor permit breaches in relation to water quantity and/or quality permits. Immediate action to rectify the non-compliance was undertaken and the environmental regulator notified in each case. Investigations were completed following these events and actions taken to prevent reoccurrence.</td>
</tr>
<tr>
<td>Description of water management risks and discussion of strategies and practices to mitigate those risks</td>

Independent Limited Assurance Report to the Directors of SSE plc on selected non-financial metrics

The Board of Directors of SSE plc ("SSE") engaged us to obtain limited assurance on the selected non-financial metrics (together the "Subject Matter Information") as defined below and marked with the symbol (A) within SSE’s Annual Report and/or SSE’S Sustainability Report for the year ended 31st March 2022 (the "Reports") available at https://www.sse.com/sustainability as specified within the 'Subject Matter Information' table below.

Our assurance conclusion does not extend to information in respect of earlier periods or to any other information included in, or linked from, the Reports including any images, audio files or videos.

Our limited assurance conclusion

Based on the procedures we have performed, as described under the ‘Summary of work performed as the basis for our assurance conclusion’ and the evidence we have obtained, nothing has come to our attention that causes us to believe that the Subject Matter Information as defined below and marked with the symbol (A) on pages 34 to 57 in SSE’s Annual Report and pages 2 to 67 and 88 to 97 in SSE’S Sustainability Report for the year ended 31st March 2022, has not been prepared, in all material respects, in accordance with the Reporting Criteria and referenced in the ‘Subject Matter Information and Reporting Criteria’ section below.

Subject Matter Information and Reporting Criteria

The Subject Matter Information needs to be read and understood together with the Reporting Criteria available at https://www.sse.com/sustainability, which SSE is solely responsible for selecting and applying. The Subject Matter Information is set out in the table below. The location of the Subject Matter Information between the Reports are shown by the symbol (A).

Inherent limitations

The absence of a significant body of established practice on which to draw to evaluate and measure non-financial information allows for different, but acceptable, evaluation and measurement techniques that can affect comparability between entities and over time.

Non-financial performance information is subject to more inherent limitations than financial information, given the characteristics of the Subject Matter Information and the evidence we have obtained, nothing has come to our attention that causes us to believe that the Subject Matter Information as defined below and marked with the symbol (A) within the SSE’s Annual Report and/or the SSE’S Sustainability Report for the year ended 31st March 2022 (the “Reports”) available at https://www.sse.com/sustainability as specified within the ‘Subject Matter Information’ table below.

Responsibilities of SSE’s directors

As explained in the Directors’ Statement on page 57 of SSE’S Annual Report and on page 1 of SSE’S Sustainability Report, the Directors of SSE are responsible for:
- determining appropriate reporting topics and selecting or establishing suitable criteria for measuring or evaluating the underlying subject matter;
- ensuring that those criteria are relevant and appropriate to SSE and the intended users of the Reports;
- the preparation of the Subject Matter Information in accordance with the Reporting Criteria including designing, implementing and maintaining systems, processes and internal controls over information relevant to the evaluation of the Subject Matter Information, which is free from material misstatement, whether due to fraud or error, against the Reporting Criteria.
- producing the Reports, including underlying information and a statement of Directors’ responsibilities for the accuracy, balance and fair presentation of the Reports.

Our responsibilities

We are responsible for:
- planning and performing the engagement to obtain limited assurance about whether the Subject Matter Information is free from material misstatement, whether due to fraud or error;
- forming an independent conclusion, based on the procedures we have performed and the evidence we have obtained; and
- reporting our conclusion to the Directors of SSE.

Professional standards applied

We performed a limited assurance engagement in accordance with International Standard on Assurance Engagements 3000 (Revised) 'Assurance Engagements other than Audits or Reviews of Historical Financial Information' and, in respect of the greenhouse gas emissions, in accordance with International Standard on Assurance Engagements 3410 Assurance engagements on greenhouse gas statements, issued by the International Auditing and Assurance Standards Board.

Our independence and quality control

We have complied with the Institute of Chartered Accountants in England and Wales Code of Ethics, which includes independence and other requirements founded on fundamental principles of integrity, objectivity, professional competence and due care, confidentiality and professional behaviour, that are at least as demanding as the applicable provisions of the International Ethics Standards Board for Accountants International Code of Ethics for Professional Accountants (Including International Independence Standards).

We apply International Standard on Quality Control (ISQC 1) and accordingly maintain a comprehensive system of quality control including documented policies and procedures regarding compliance with ethical requirements, professional standards and applicable legal and regulatory requirements.

Summary of work performed as the basis for our assurance conclusion

In carrying out our limited assurance engagement we:
- considered the suitability in the circumstances of SSE’s use of the Reporting Criteria, as the basis for preparing the Subject Matter Information;
- through inquiries with SSE’s management, including the Sustainability team and those with responsibility for sustainability management and group sustainability reporting obtained an understanding of SSE’s control environment, processes and systems relevant to the preparation of the Subject Matter Information;
- evaluated whether SSE’s methods for developing estimates are appropriate and had been consistently applied;
- undertook site visits at one of SSE’s power station sites; we selected these sites based on their potential risk and materiality to the group, and unexpected fluctuations in the site Subject Matter Information since the prior period;
- performed limited substantive testing on a selective basis of the Subject Matter Information at corporate head office to check that underlying information had been appropriately evaluated or measured, recorded, collated and reported; and
- considered the disclosure and presentation of the Subject Matter Information.

Our procedures did not include evaluating the suitability of design or operating effectiveness of control activities, testing the data on which the estimates are based or separately developing our own estimates against which to evaluate SSE’s estimates.

The procedures performed in a limited assurance engagement vary in nature and timing from, and are less in extent than for, a reasonable assurance engagement. Consequently, the level of assurance obtained in a limited assurance engagement is substantially lower than the assurance that would have been obtained had a reasonable assurance engagement been performed.

Other information

The other information comprises all of the information in the Reports other than the Subject Matter Information and our assurance report. The directors are responsible for the other information. As explained above, our assurance conclusion does not extend to the other information and, accordingly, we do not express any form of assurance thereon. Information with respect to the Subject Matter Information, our responsibility is to read the other information and, in doing so, consider whether the other information is materially inconsistent with the Subject Matter Information.

Use and distribution of our report

This report, including our conclusion, has been prepared solely for the Board of Directors of SSE in accordance with the agreement between us dated 2nd March 2022 (the “agreement”). Our report must not be made available to any other party save as set out in the agreement. The full extent permitted by law, we do not accept or assume responsibility or liability to anyone other than the Board of Directors and SSE for our work or this report except where terms are expressly agreed between us in writing.
